## 7. ENVIRONMENTAL CHARACTERISTICS

### (1) Short Time Over Load Test

At 2.5 times of the rated voltage applied for 5 seconds, the resistor should be free from defects after the resistor is released from load for about 30 minutes

$$\text{Short Time Overload Voltage} = 2.5 * \sqrt{\text{Power Rating} \times \text{Resistance Value}}$$

The change of the resistance value should be within ± 2.0 % + 0.05Ω

### (2) Dielectric Withstanding Voltage

The resistor is placed on the metal V Block. Apply a Table I dielectric withstanding between the terminals connected together with the block for about 60 seconds.

The resistor shall be able to withstand without breakdown or flashover.

(3) Temperature Coefficient Test

Test of resistors above room temperature  $100^{\circ}\text{C} \pm 2^{\circ}\text{C}$  ( Testing Temperature  $115^{\circ}\text{C}$  to  $130^{\circ}\text{C}$  ) at the constant temperature silicon plate for over 5 minutes. Then measure the resistance value.  
The Temperature Coefficient is calculated by the following equation and its value should be within the range of requested.

$$\text{Resistor Temperature Coefficient} = \frac{R - R_0}{R_0} \times \frac{1}{t - t_0} \times 10^6$$

$R$  = Resistance value under the testing temperature

$R_0$  = Resistance value at the room temperature

$t$  = The testing temperature

$t_0$  = Room temperature

(4) Insulation Resistance

Apply test terminal on lead and resistor body.

The test resistance should be high than 100M ohm.

(5) Solderability

Immerse the specimen into the solder pot at  $235 \pm 5^{\circ}\text{C}$  for  $5 \pm 0.5$  seconds.

At least 95% solder coverage on the termination.

(6) Resistance to Solvent

The specimen into the appropriate solvent of IPA condition of ultrasonic machine for 1 minutes.

The specimen is no deterioration of coatings and color code.

(7) Terminal Strength

Direct Load – Resistors shall be held by one terminal and the load shall be gradually applied in the direction of the longitudinal axis of the resistor unit the applied load reaches 5 pounds °

The load shall be held for 10 seconds. The load of weight shall be  $\geq 2.5 \text{ kg}$  ( 24.5N ).

(8) Rated Load

At 4 times of the rated voltage applied for 30 minutes, the resistor should be free from defects after the resistor is released from load for about 30 minutes

The change of the resistance value shall be within  $\pm 1.0\% + 0.05 \Omega$

(9) Load Life in Humidity

Place the specimen in a test chamber at  $40 \pm 2^{\circ}\text{C}$  and 90 ~ 95 % relative humidity. Apply the rated voltage to the specimen at the 1.5 hours on and 0.5 hour off cycle. The total length of test is 1,000 hours

The change of the resistance value shall be within  $\pm 5\% + 0.05 \Omega$

(10) Load Life Test

Placed in the constant temperature chamber of  $70 \pm 3^{\circ}\text{C}$  the resistor shall be connected to the lead wire at the point of 25mm. Length with each terminal, the resistors shall be arranged not much effected mutually by the temperature of the resistors and the excessive ventilation shall not be performed, for 90 minutes on and 30 minutes off under this condition the rated D.C. voltage is applied continuously for 1000+48/-0 hours then left at no-load for 1hour, measured at this time the resistance value °

The change of the resistance value shall be within  $\pm 5\% + 0.05 \Omega$ .

There shall be no remarkable change in the appearance and the color code shall be legible after the test.

#### (11) Temperature Cycling Test

The temperature cycle shown in the following table shall be repeated 5 times consecutively. The measurement of the resistance value is done before the first cycle and after ending the fifth cycle, leaving in the room temperature for about 1 hour °

Temperature Cycling Conditions:

Step	Temperature(°C)	Time (minute)
1	-55 ± 3	30
2	25 ± 3	2 ~ 3
3	155 ± 3	30
4	25 ± 3	2 ~ 3

The change of the resistance value shall be within  $\pm 1.0 \% + 0.05 \Omega$

#### (13) Overload Flame Retardant

At 4 times of the rated voltage applied for 1 minute

Overload Test Voltage =  $4 * \sqrt{\text{Power Rating} \times \text{Resistance Value}}$

The resistor shall be able to no evidence of flaming arcing.
