

### 0.8% Low Voltage Detector with Output Delay

NO.EA-161-140819

## OUTLINE

The R3116x series are CMOS-based voltage detector ICs with high detector threshold accuracy and ultra-low supply current, which can be operated at an extremely low voltage and is used for system reset as an example.

Each of these ICs consists of a voltage reference unit, a comparator, resistors for detector threshold setting, an output driver, a hysteresis circuit and an output delay circuit. The detector threshold is internally fixed with high accuracy and does not require any adjustment.

Two output types, Nch open drain type and CMOS type are available.

The R3116x series are operable at a lower voltage than that of the R3112x series, and can be driven by a single battery.

Three types of packages, SOT-23-5, SC-82AB, and DFN(PLP)1010-4 are available.

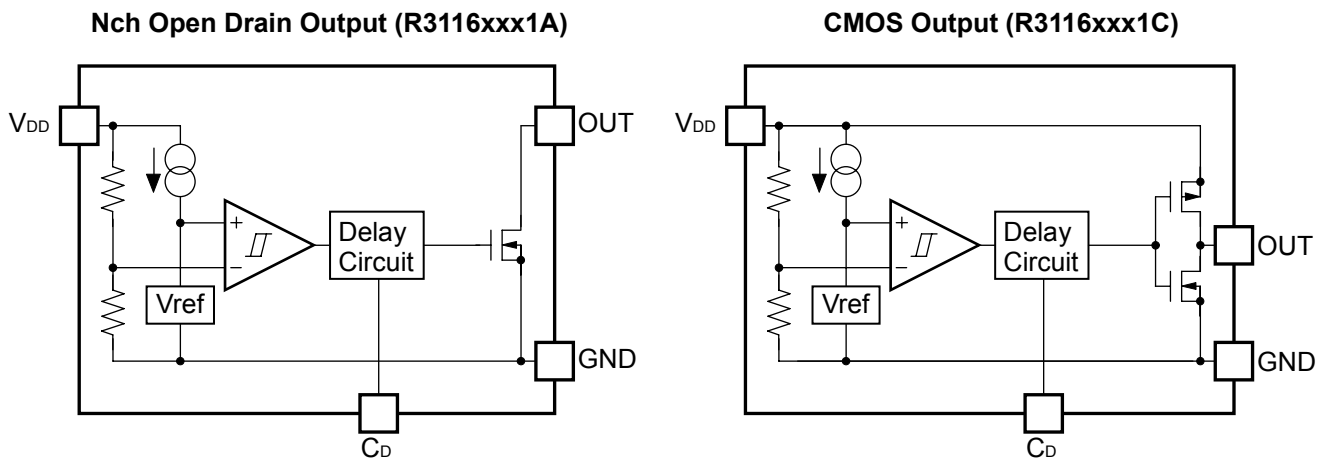

## FEATURES

- Supply Current ..... Typ. 0.35 $\mu$ A ( $-V_{DET}=1.5V$ ,  $V_{DD}=-V_{DET}+1V$ )
- Operating Voltage Range..... 0.5V to 6.0V ( $T_{opt}=25^{\circ}C$ )
- Detector Threshold Range ..... 0.7V to 5.0V (0.1V step)
- Detector Threshold Accuracy .....  $\pm 0.8\%$  ( $-V_{DET} \geq 1.5V$ )
- Temperature-Drift Coefficient of Detector Threshold ..... Typ.  $\pm 30ppm/^{\circ}C$
- Built-in Output Delay Circuit..... Typ. 100ms with an external capacitor: 0.022 $\mu$ F
- Output Delay Time Accuracy.....  $\pm 15\%$  ( $-V_{DET} \geq 1.5V$ )
- Output Types..... Nch Open Drain "L" and CMOS
- Packages ..... DFN(PLP)1010-4, SC-82AB, SOT-23-5

## APPLICATIONS

- CPU and Logic Circuit Reset
- Battery Checker
- Window Comparator
- Wave Shaping Circuit
- Battery Back-up Circuit
- Power Failure Detector

$T_{stg}$	Storage Temperature Range	-55 to 125	°C

\* Please refer to *PACKAGE INFORMATION* for detailed information.

**ABSOLUTE MAXIMUM RATINGS**

Electronic and mechanical stress momentarily exceeded absolute maximum ratings may cause the permanent damages and may degrade the life time and safety for both device and system using the device in the field. The functional operation at or over these absolute maximum ratings is not assured.

**RECOMMENDED OPERATING CONDITIONS (ELECTRICAL CHARACTERISTICS)**

All of electronic equipment should be designed that the mounted semiconductor devices operate within the recommended operating conditions. The semiconductor devices cannot operate normally over the recommended operating conditions, even if when they are used over such conditions by momentary electronic noise or surge. And the semiconductor devices may receive serious damage when they continue to operate over the recommended operating conditions.

## TIMING CHART

When the supply voltage, which is higher than released voltage, is forced to  $V_{DD}$  pin, charge to an external capacitor starts, then  $C_D$  pin voltage increases. Until the  $C_D$  pin voltage reaches to  $C_D$  pin threshold voltage, output voltage maintains "L". When the  $C_D$  pin voltage becomes higher than  $C_D$  pin threshold voltage, output voltage is reversed from "L" to "H". Where the time interval between the rising edge of supply voltage and output voltage reverse point means output delay time.

When the output voltage reverses from "L" to "H", the external capacitor starts to discharge. Therefore, when lower voltage than the detector threshold voltage is forced to  $V_{DD}$  pin, the output voltage reverses from "H" to "L" thus the detect delay time is constant not being affected by the external capacitor.

### • Output Delay Time

Output Delay Time ( $t_D$ ) can be calculated with the next formula using the external capacitor:

$$t_D(s) = 4.5 \times 10^6 \times C_D(F)$$

## DEFINITION OF OUTPUT DELAY TIME

Output Delay Time ( $t_D$ ) is defined as follows:

### 1. In the case of Nch Open Drain Output:

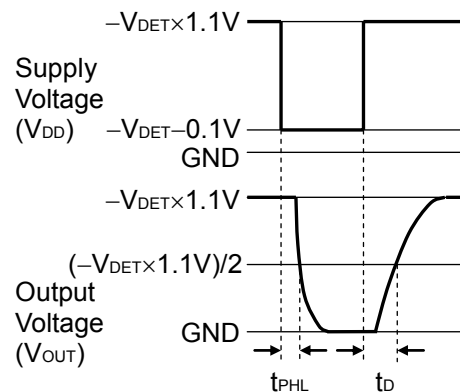

Under the condition of the output pin (OUT) is pulled up through a resistor of 470k $\Omega$  to 5V, the time interval between the rising edge of  $V_{DD}$  pulse from  $(-V_{DET})-0.1V$  to  $(-V_{DET}) \times 1.1V$  pulse voltage is supplied, the becoming of the output voltage to 2.5V.

### 2. In the case of CMOS Output:

The time interval between the rising edge of  $V_{DD}$  pulse from  $(-V_{DET})-0.1V$  to  $(-V_{DET}) \times 1.1V$  pulse voltage is supplied, the becoming of the output voltage to  $((-V_{DET}) \times 1.1V)/2$ .

## TECHNICAL NOTES

### When connecting resistors to the device's input pin

When connecting a resistor (R1) to an input of this device, the input voltage decreases by [Device's Consumption Current] x [Resistance Value] only. And, the cross conduction current<sup>\*1</sup>, which occurs when changing from the detecting state to the release state, is decreased the input voltage by [Cross Conduction Current] x [Resistance Value] only. And then, this device will enter the re-detecting state if the input voltage reduction is larger than the difference between the detector voltage and the released voltage.

When the input resistance value is large and the VDD is gone up at mildly in the vicinity of the released voltage, repeating the above operation may result in the occurrence of output.

As shown in Figure A/B, set R1 to become 100kΩ or less as a guide, and connect C<sub>IN</sub> of 0.1μF and more to between the input pin and GND. Besides, make evaluations including temperature properties under the actual usage condition, with using the evaluation board like this way. As result, make sure that the cross conduction current has no problem.

$$I \quad \frac{R_b + R_c}{R_a + R_b + R_c} \times V_{DD}$$

$$II \quad \frac{R_b}{R_a + R_b} \times V_{DD}$$

### • Explanation of operation

Step 1. The output voltage is equal to the pull-up voltage.

Step 2. At Point "A",  $V_{ref} \geq V_{DD} \times (R_b + R_c) / (R_a + R_b + R_c)$  is true, as a result, the output of comparator is reversed from "L" to "H", therefore the output voltage becomes the GND level. The voltage level of Point A means a detector threshold voltage ( $-V_{DET}$ ).

Step 3. When the supply voltage is lower than the minimum operating voltage, the operation of the output transistor becomes indefinite. The output voltage is equal to the pull-up voltage.

Step 4. The output voltage is equal to the GND level.

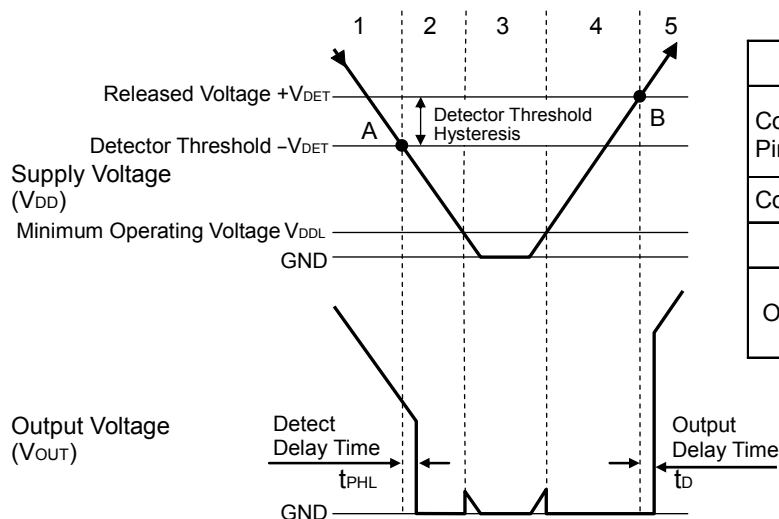

Step 5. At Point "B",  $V_{ref} \leq V_{DD} \times R_b / (R_a + R_b)$  is true, as a result, the output of comparator is reversed from "H" to "L", then the output voltage is equal to the pull-up voltage. The voltage level of Point B means a released voltage ( $+V_{DET}$ ).

\*) The difference between a released voltage and a detector threshold voltage is a detector threshold hysteresis.

**POWER DISSIPATION (SC-82AB)**

Power Dissipation ( $P_D$ ) depends on conditions of mounting on board. This specification is based on the measurement at the condition below;

## \* Measurement Conditions

	Standard Land Pattern
Environment	Mounting on Board (Wind velocity=0m/s)
Board Material	Glass cloth epoxy plastic (Double Layers)
Board Dimensions	40mm × 40mm × 1.6mm
Copper Ratio	Top side: Approx. 50%, Back side: Approx. 50%
Through-hole	φ0.5mm × 44pcs

## \* Measurement Result

(Ta=25°C, Tjmax=125°C)

	Standard Land Pattern	Free Air
Power Dissipation	380mW	150mW
Thermal Resistance	$\theta_{ja} = (125-25^\circ\text{C})/0.38\text{W} = 263^\circ\text{C/W}$	667°C/W

1. The products and the product specifications described in this document are subject to change or discontinuation of production without notice for reasons such as improvement. Therefore, before deciding to use the products, please refer to Ricoh sales representatives for the latest information thereon.
2. The materials in this document may not be copied or otherwise reproduced in whole or in part without prior written consent of Ricoh.
3. Please be sure to take any necessary formalities under relevant laws or regulations before exporting or otherwise taking out of your country the products or the technical information described herein.
4. The technical information described in this document shows typical characteristics of and example application circuits for the products. The release of such information is not to be construed as a warranty of or a grant of license under Ricoh's or any third party's intellectual property rights or any other rights.
5. The products in this document are designed for automotive applications. However, when using the products for automotive applications, please make sure to contact Ricoh sales representative in advance due to confirming the quality level.
6. We are making our continuous effort to improve the quality and reliability of our products, but semiconductor products are likely to fail with certain probability. In order to prevent any injury to persons or damages to property resulting from such failure, customers should be careful enough to incorporate safety measures in their design, such as redundancy feature, firecontainment feature and fail-safe feature. We do not assume any liability or responsibility for any loss or damage arising from misuse or inappropriate use of the products.
7. Anti-radiation design is not implemented in the products described in this document.
8. Please contact Ricoh sales representatives should you have any questions or comments concerning the products or the technical information.

**For the conservation of the global environment, Ricoh is advancing the decrease of the negative environmental impact material.**  
After Apr. 1, 2006, we will ship out the lead free products only. Thus, all products that will be shipped from now on comply with RoHS Directive.  
Basically after Apr. 1, 2012, we will ship out the Power Management ICs of the Halogen Free products only. (RicoH Halogen Free products are also Antimony Free.)
