

## 400mA Inductor Built-in Step-Down “micro DC/DC” Converters

☆GreenOperation Compatible

### ■GENERAL DESCRIPTION

The XCL208/XCL209 series is a synchronous step-down micro DC/DC converter which integrates an inductor and a control IC in one tiny package (2.5mm×2.15mm, h=1.05mm). A stable power supply with an output current of 400mA is configured using only two capacitors connected externally.

An internal coil simplifies the circuit and enables minimization of noise and other operational trouble due to the circuit wiring.

A wide operating voltage range of 1.8V (2.0V) to 6.0V enables support for applications that require an alkaline battery (2-cell) or AC adapter (5V) power supply. An internally fixed output voltage (0.8V to 4.0V) or an externally set output voltage can be selected.

The XCL208/XCL209 series uses synchronous rectification at an operating frequency of 3.0MHz. PWM control (XCL208) or automatic PWM/PFM switching control (XCL209) can be selected. The XCL208 series has a fixed frequency, enabling the suppression of output ripple. The XCL209 series achieves high efficiency while holding down output ripple across the full range of loads, from light to heavy, enabling the extension of battery operation time.

Soft start and on/off functions with  $C_L$  discharge are provided, and the IC can be put in the standby state by inputting a Low level signal into the CE pin.

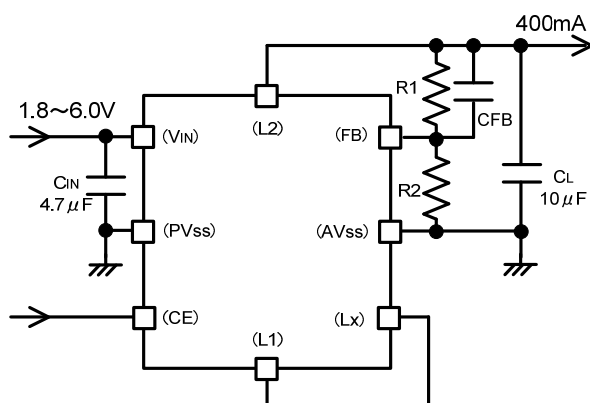

### ■APPLICATIONS

- Mobile phones, Smart phones
- Bluetooth Headsets
- Tablet PCs
- PND
- PC peripheral devices
- DSC, Camcorders

### ■TYPICAL APPLICATION CIRCUIT

XCL208A / XCL208B / XCL209A / XCL209B Type

XCL208F / XCL209F Type

### ■FEATURES

Input Voltage	: 1.8V ~ 6.0V (Type F) : 2.0V ~ 6.0V (Type A/B)
Fixed Output Voltage	: 0.8V ~ 4.0V ( $\pm 2.0\%$ )
High Efficiency	: 90% ( $V_{IN}=4.2V$ , $V_{OUT}=3.3V$ )
Output Current	: 400mA
Oscillation Frequency	: 3.0MHz ( $\pm 15\%$ )
CE Function	: Active High Soft-start Circuit Built-in $C_L$ High Speed Auto Discharge
Protection Circuits	: Current Limiter Built-in (Constant Current & Latching)
Control Methods	: PWM (XCL208) PWM/PFM (XCL209)
Operating Ambient Temperature	: $-40^{\circ}\text{C} \sim +85^{\circ}\text{C}$
Package	: USP-10B03
Environmentally Friendly	: EU RoHS Compliant, Pb Free

### ■TYPICAL PERFORMANCE CHARACTERISTICS

● Efficiency vs. Output Current

## BLOCK DIAGRAM

1) XCL208A / XCL209A Type

2) XCL208B / XCL209B Type

3) XCL208F / XCL209F Type

### NOTE:

The XCL208 offers a fixed PWM control, a signal from CE Control Logic to PWM/PFM Selector is fixed to "L" level inside. The XCL209 control scheme is PWM/PFM automatic switching, a signal from CE Control Logic to PWM/PFM Selector is fixed to "H" level inside. The diodes placed inside are ESD protection diodes and parasitic diodes.

## ■PRODUCT CLASSIFICATION

XCL208①②③④⑤⑥ Fixed PWM

XCL209①②③④⑤⑥ PWM/PFM Auto Switching

DESIGNATOR	ITEM	SYMBOL	DESCRIPTION
①	Type	A	$V_{IN} \geq 2.0V$ Fixed Output Voltage Standard soft-start , No $C_L$ auto discharge
		B	$V_{IN} \geq 2.0V$ Fixed Output Voltage $C_L$ auto discharge, High speed soft-start
		F	$V_{IN} \geq 1.8V$ Output Voltage External Setting $C_L$ auto discharge, High speed soft-start
②③	Output Voltage <sup>(*)</sup>	10	1.0V
		12	1.2V
		15	1.5V
		18	1.8V
		25	2.5V
		28	2.8V
		2L	2.85V
		30	3.0V
		33	3.3V
		08	External Setting 0.8V (XCL208F/XCL209F)
④	Oscillation Frequency	3	3.0MHz
⑤⑥ <sup>(*)</sup>	Package (Order Unit)	DR	USP-10B03 (3,000/Reel)

<sup>(\*)</sup> When other output voltages (semi-custom) are needed, please contact your local Torex sales office for more information.

Output voltage range is 0.8~4.0V.

<sup>(\*)</sup> Halogen free and EU RoHS compliant.

## PIN CONFIGURATION

(BOTTOM VIEW)

## PIN ASSIGNMENT

PIN NUMBER USP-10B03	PIN NAME	FUNCTIONS
1	PVSS	(Power) Ground
2	LX	Switching Output
3	NC	No Connection
4	FB	Output Voltage Sense Pin (Type F)
	VOUT	Fixed Output Voltage Pin (Type A/B)
5	AVSS	(Analog) Ground
6	CE	Active High Enable
7	NC	No Connection
8	VIN	Power Supply Input
9	L1	Inductor Electrodes
10	L2	Inductor Electrodes

## FUNCTION

PIN NAME	SIGNAL	CONDITIONS	STATUS
CE	L	$AV_{SS} \leq V_{CE} \leq 0.25V$	Stand-by
	H	$0.65V \leq V_{CE} \leq 6V$	Active

\* When the CE pin is left open, the IC may operate unstable. Please do not leave the CE pin open.

## ABSOLUTE MAXIMUM RATINGS

Ta=25°C

PARAMETER	SYMBOL	RATINGS	UNITS
Input Voltage	$V_{IN}$	-0.3~6.5	V
Lx Pin Voltage	$V_{Lx}$	-0.3~ $V_{IN}+0.3 \leq 6.5$	V
Output Voltage	$V_{OUT}$	-0.3~6.5	V
CE Input Voltage	$V_{CE}$	-0.3~6.5	V
Lx Pin Current	$I_{Lx}$	±1500	mA
Power Dissipation <sup>(*)</sup>	Pd	500	mW
Operating Ambient Temperature	Topr	-40~+85	°C
Storage Temperature	Tstg	-40~+125	°C

Each voltage rating uses the  $V_{SS}$  pin as a reference.

<sup>(\*)</sup> The value is an example data which is taken with the PCB mounted.

CE "L" Voltage	$V_{CEL}$	$V_{OUT}=0V$ , Applied voltage to $V_{CE}$ , Voltage changes Lx to "L" level <sup>(10)</sup>	$AV_{SS}$	-	0.25	V	③
CE "H" Current	$I_{CEH}$	$V_{IN}=V_{CE}=5.0V$ , $V_{OUT}=0V$	-0.1	-	0.1	$\mu A$	⑤
CE "L" Current	$I_{CEL}$	$V_{IN}=5.0V$ , $V_{CE}=0V$ , $V_{OUT}=0V$	-0.1	-	0.1	$\mu A$	⑤
Soft-start Time	$t_{SS}$	$V_{CE}=0V \rightarrow V_{IN}$ , $I_{OUT}=1mA$	0.5	0.90	2.50	ms	①
Latch Time	$t_{LAT}$	$V_{IN}=V_{CE}=5.0V$ , $V_{OUT}=0.8 \times V_{OUT(T)}$ , Short Lx at 1 $\Omega$ resistance <sup>(6)</sup>	1	-	20	ms	⑦
Short Protection Threshold Voltage	$V_{SHORT}$	Sweeping $V_{OUT}$ , $V_{IN}=V_{CE}=5.0V$ , Short Lx at 1 $\Omega$ resistance, $V_{OUT}$ voltage which Lx becomes "L" level within 1ms	<E-8>	<E-9>	<E-10>	V	⑦
Inductance Value	L	Test Frequency=1MHz	-	1.5	-	$\mu H$	-
Allowed Inductor Current	$I_{DC}$	$\Delta T=40^{\circ}C$	-	700	-	mA	-

Test conditions: Unless otherwise stated,  $V_{IN}=5.0V$ ,  $V_{OUT(T)}$ =Nominal Voltage

NOTE:

<sup>(1)</sup> Including hysteresis operating voltage range.

<sup>(2)</sup>  $EFFI = \{ (\text{output voltage} \times \text{output current}) / (\text{input voltage} \times \text{input current}) \} \times 100$

<sup>(3)</sup> ON resistance ( $\Omega$ )=( $V_{IN}$  - Lx pin measurement voltage) / 100mA

<sup>(4)</sup> Design value

<sup>(5)</sup> When temperature is high, a current of approximately 10  $\mu A$  (maximum) may leak.

<sup>(6)</sup> Time until it short-circuits  $V_{OUT}$  with GND via 1 $\Omega$  of resistor from an operational state and is set to  $Lx=0V$  from current limit pulse generating.

<sup>(7)</sup> When  $V_{IN}$  is less than 2.4V, limit current may not be reached because voltage falls caused by ON resistance.

<sup>(8)</sup> When the difference between the input and the output is small, some cycles may be skipped completely before current maximizes.

If current is further pulled from this state, output voltage will decrease because of P-ch driver ON resistance.

<sup>(9)</sup> Current limit denotes the level of detection at peak of coil current.

<sup>(10)</sup> "H"= $V_{IN}-V_{IN}-1.2V$ , "L"= $+0.1V \sim -0.1V$

<sup>(11)</sup>  $I_{PFM}$  and  $DTY_{LIMIT\_PFM}$  are defined only for the XCL209 series.

### <XCL208/XCL209 F type output voltage setting>

The output voltage can be set by adding external dividing resistors. The output voltage is determined by R1 and R2 in the equation below. The sum of R1 and R2 is normally kept 1MΩ or less. The output voltage range can be set from 0.9V to 6.0V based on the 0.8V ±2.0% reference voltage source.

Note that when the input voltage (V<sub>IN</sub>) is less than or equal to the set output voltage, an output voltage (V<sub>OUT</sub>) higher than the input voltage (V<sub>IN</sub>) cannot be output.

$$V_{OUT}=0.8 \times (R1+R2)/R2$$

Adjust the value of the phase compensation speedup capacitor C<sub>FB</sub> so that fz<sub>fb</sub>=1/(2×π×C<sub>FB</sub>×R1) is 10kHz or less. It is optimum to adjust to a value from 1kHz to 20kHz based on the components used and the board layout.

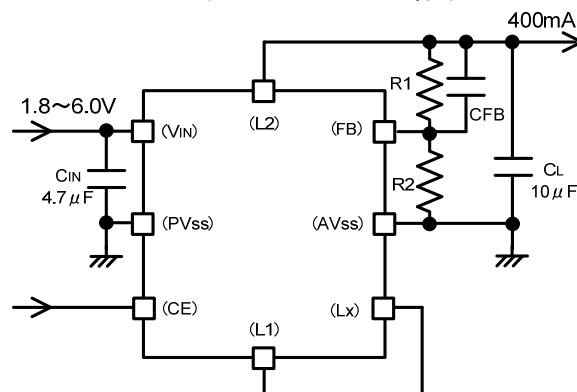

[Calculation example]

When R1=470kΩ, R2=150kΩ, V<sub>OUT</sub>=0.8×(470k+150k)/150k=3.3V

e.g.

V <sub>OUT</sub> (V)	R1 (kΩ)	R2 (kΩ)	C <sub>FB</sub> (pF)
0.9	100	820	150
1.2	150	300	100
1.5	130	150	220
1.8	300	240	150
2.5	510	240	100
3.0	330	120	150
3.3	470	150	100
4.0	120	30	470

## OPERATIONAL DESCRIPTION

The XCL208/XCL209 series consists of a reference voltage source, ramp wave circuit, error amplifier, PWM comparator, phase compensation circuit, output voltage adjustment resistors, P-ch MOSFET driver transistor, N-ch MOSFET switching transistor for the synchronous switch, current limiter circuit, UVLO circuit with control IC, and an inductor. (See the block diagram below.) Using the error amplifier, the voltage of the internal voltage reference source is compared with the feedback voltage from the  $V_{OUT}$  pin through split resistors, R1 and R2. Phase compensation is performed on the resulting error amplifier output, to input a signal to the PWM comparator to determine the turn-on time during PWM operation. The PWM comparator compares, in terms of voltage level, the signal from the error amplifier with the ramp wave from the ramp wave circuit, and delivers the resulting output to the buffer driver circuit to cause the Lx pin to output a switching duty cycle. This process is continuously performed to ensure stable output voltage. The current feedback circuit monitors the P-ch MOS driver transistor current for each switching operation, and modulates the error amplifier output signal to provide multiple feedback signals. This enables a stable feedback loop even when a low ESR capacitor such as a ceramic capacitor is used ensuring stable output voltage.

Type A

### <Reference Voltage Source>

The reference voltage source provides the reference voltage to ensure stable output voltage of the DC/DC converter.

### <Ramp Wave Circuit>

The ramp wave circuit determines switching frequency. The frequency is fixed internally 3.0MHz. Clock pulses generated in this circuit are used to produce ramp waveforms needed for PWM operation, and to synchronize all the internal circuits.

### <Error Amplifier>

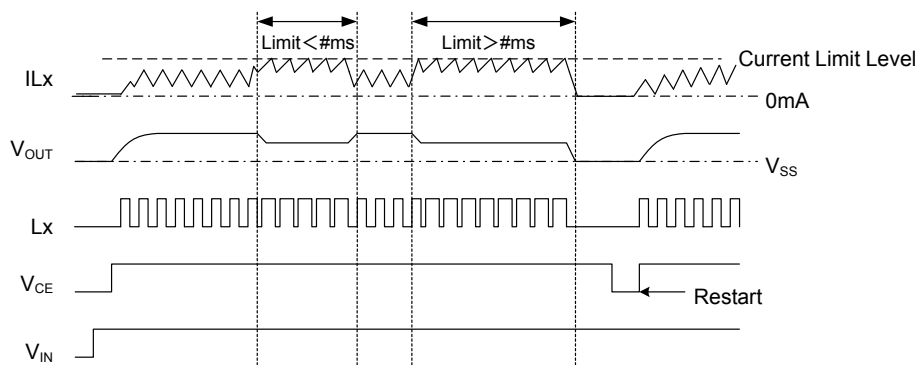

The error amplifier is designed to monitor output voltage. The amplifier compares the reference voltage with the feedback (Type F: FB pin voltage) divided by the internal split resistors, R1 and R2. When a feedback voltage is lower than the reference voltage, the output voltage of the error amplifier is increased. The gain and frequency characteristics of the error amplifier output are fixed internally to deliver an optimized signal to the mixer.

### <Current Limit>

The current limiter circuit of the XCL208/XCL209 series monitors the current flowing through the P-ch MOS driver transistor connected to the Lx pin, and features a combination of the current limit mode and the operation suspension mode.

- ① When the driver current is greater than a current limit level, the current limit function operates to turn off the pulses from the Lx pin at any given timing.
- ② When the driver transistor is turned off, the limiter circuit is then released from the current limit detection state.
- ③ At the next pulse, the driver transistor is turned on. However, the transistor is immediately turned off in the case of an over current state.
- ④ When the over current state is eliminated, the IC resumes its normal operation.

The IC waits for the over current state to end by repeating the steps ① through ③. If an over current state continues for a latch time and the above three steps are repeatedly performed, the IC performs the function of latching the OFF state of the driver transistor, and goes into operation suspension state. Once the IC is in suspension state, operations can be resumed by either turning the IC off via the CE pin, or by restoring power to the  $V_{IN}$  pin. The suspension state does not mean a complete shutdown, but a state in which pulse output is suspended; therefore, the internal circuitry remains in operation. The current limit of the XCL208/XCL209 series can be set at 800mA at typical. Depending on the state of the PC Board, latch time may become longer and latch operation may not work. In order to avoid the effect of noise, an input capacitor is placed as close to the IC as possible.

## ■ OPERATIONAL DESCRIPTION(Continued)

### <Short-Circuit Protection>

The short-circuit protection circuit monitors the internal R1 and R2 divider voltage (Type F: FB pin voltage). In case where output is accidentally shorted to the Ground and when the FB point voltage decreases less than half of the reference voltage (Vref) and a current more than the  $I_{LIM}$  flows to the driver transistor, the short-circuit protection quickly operates to turn off and to latch the driver transistor. In the latch state, the operation can be resumed by either turning the IC off and on via the CE pin, or by restoring power supply to the  $V_{IN}$  pin.

Also, when sharp load transient happens, a voltage drop at the  $V_{OUT}$  is propagated through  $C_{FB}$ , as a result, short circuit protection may operate in the voltage higher than short-circuit protection voltage.

### <UVLO Circuit>

When the  $V_{IN}$  pin voltage becomes 1.4V (TYP.) or lower, the P-channel output driver transistor is forced OFF to prevent false pulse output caused by unstable operation of the internal circuitry. When the  $V_{IN}$  pin voltage becomes 1.8V or higher, by releasing the UVLO state then the soft-start function initiates output startup operation. The soft-start function operates even when the  $V_{IN}$  pin voltage falls momentarily below the UVLO operating voltage same as releasing the UVLO function. The UVLO circuit does not cause a complete shutdown of the IC, but causes pulse output to be suspended; therefore, the internal circuitry remains in operation.

### <PFM Switch Current>

In PFM control operation, until coil current reaches to  $I_{PFM}$ , the IC keeps the P-ch MOSFET on.

In this case, on-time ( $t_{ON}$ ) that the P-ch MOSFET is kept on can be given by the following formula.

$$t_{ON} = L \times I_{PFM} / (V_{IN} - V_{OUT}) \rightarrow I_{PFM} \textcircled{1}$$

### <PFM Duty Limit>

In the PFM control operation, the maximum PFM Duty Limit is set to 200% (TYP.). Therefore, under the condition that the step-down ratio is small, it's possible for P-ch MOSFET to be turned off even when coil current doesn't reach to  $I_{PFM}$ .  $\rightarrow I_{PFM} \textcircled{2}$

### <CL High Speed Discharge>

The XCL208B/XCL209B and the XCL208F/XCL209F can quickly discharge the electric charge at the output capacitor ( $C_L$ ) when a low signal to the CE pin which enables a whole IC circuit put into OFF state, is inputted via the N-ch transistor located between the  $L_X$  pin and the  $V_{SS}$  pin. When the IC is disabled, electric charge left at the output capacitor ( $C_L$ ) is quickly discharged so that it may avoid application malfunction. Discharge time is set by the  $C_L$  auto-discharge resistance ( $R_{DCHG}$ ) and the output capacitance ( $C_L$ ). By setting time constant as  $\tau$  ( $\tau = C_L \times R_{DCHG}$ ), discharge time of the output voltage is calculated by the following formula.

$$V = V_{OUT(T)} \times e^{-t/\tau} \text{ or } t = \tau \ln (V_{OUT(T)} / V)$$

$V$  : Output voltage after discharge

$V_{OUT(T)}$  : Output voltage

$t$  : Discharge time,

$\tau$  :  $C_L \times R_{DCHG}$

$C_L$  : Output capacitance ( $C_L$ )

$R_{DCHG}$  :  $C_L$  auto-discharge resistance

Output Voltage Discharge Characteristics  
 $R_{dischg} = 300\Omega$  (TYP)

## ■ OPERATIONAL DESCRIPTION(Continued)

### <CE Pin Function>

The operation of the XCL208/XCL209 series will enter into the stand-by mode when a low level signal is input to the CE pin. During the stand-by mode, the current consumption of the IC becomes  $0\mu\text{A}$  (TYP.), with a state of high impedance at the Lx pin and VOUT pin. The IC starts its operation by inputting a high level signal to the CE pin. The input to the CE pin is a CMOS input and the sink current is  $0\mu\text{A}$  (TYP.).

(A)

SW_CE	OPERATIONAL STATES
ON	Stand-by
OFF	Active

(B)

SW_CE	OPERATIONAL STATES
ON	Active
OFF	Stand-by

### <Soft-Start>

Soft-start time is internally set. Soft-start time is defined as the time to reach 90% of the output nominal voltage when the CE pin is turned on.

## NOTE ON USE

- For temporary, transitional voltage drop or voltage rising phenomenon, the IC is liable to malfunction should the ratings be exceeded.
- The XCL208/XCL209 series is designed for use with ceramic output capacitors. If, however, the potential difference is too large between the input voltage and the output voltage, a ceramic capacitor may fail to absorb the resulting high switching energy and oscillation could occur on the output. In this case, increase 10  $\mu$ F to the output capacitance for adding insufficient capacitance. Also, if the output capacitance is too large, the output voltage is slowly rising and the IC may not operate. Adjust the output capacitance so that the output voltage can go up within the soft-start time.
- Spike noise and ripple voltage arise in a switching regulator as with a DC/DC converter. These are greatly influenced by external component selection, such as the coil inductance, capacitance values, and board layout of external components. Once the design has been completed, verification with actual components should be done.
- Depending on the input-output voltage differential, or load current, some pulses may be skipped as 1/2, 1/3 and the ripple voltage may increase.
- When the difference between input and output is large in PWM control, very narrow pulses will be outputted, and there is the possibility that 0% duty cycles may be continued during some cycles.
- When the difference between input and output is small, and the load current is heavy, very wide pulses will be outputted and there is the possibility that 100% duty cycles may be continued during some cycles.
- With the IC, the peak current of the coil is controlled by the current limit circuit. Since the peak current of the coil increases when dropout voltage or load current is high, current limit starts operation, and this can lead to instability. When peak current becomes high, please adjust the coil inductance value and fully check the circuit operation. In addition, please calculate the peak current according to the following formula:  

$$I_{pk} = (V_{IN} - V_{OUT}) \times \text{OnDuty} / (2 \times L \times f_{OSC}) + I_{OUT}$$

L: Coil Inductance Value  
 $f_{OSC}$ : Oscillation Frequency
- When the peak current which exceeds limit current flows within the specified time, the built-in P-ch driver transistor turns off. During the time until it detects limit current and before the built-in transistor can be turned off, the current for limit current flows; therefore, care must be taken when selecting the rating for the external components such as a coil.
- When  $V_{IN}$  is less than 2.4V, limit current may not be reached because voltage falls caused by ON resistance.
- Depending on the state of the PC Board, latch time may become longer and latch operation may not work. In order to avoid the effect of noise, the board should be laid out so that input capacitors are placed as close to the IC as possible.
- Use of the IC at voltages below the minimum operating voltage range may lead to instability.
- This IC should be used within the stated absolute maximum ratings of external components in order to prevent damage to the device.
- When the IC is used in high temperature, output voltage may increase up to input voltage level at no load because of the leak current of the driver transistor.
- The current limit is set to 1000mA (MAX.) at typical. However, the current of 1000mA or more may flow.  
 In case that the current limit functions while the  $V_{OUT}$  pin is shorted to the GND pin, when P-ch MOSFET is ON, the potential difference for input voltage will occur at both ends of a coil. For this, the time rate of coil current becomes large. By contrast, when N-ch MOSFET is ON, there is almost no potential difference at both ends of the coil since the  $V_{OUT}$  pin is shorted to the GND pin. Consequently, the time rate of coil current becomes quite small. According to the repetition of this operation, and the delay time of the circuit, coil current will be converged on a certain current value, exceeding the amount of current, which is supposed to be limited originally. Even in this case, however, after the over current state continues for several ms, the circuit will be latched. A coil should be used within the stated absolute maximum rating in order to prevent damage to the device.
  - Current flows into P-ch MOSFET to reach the current limit ( $I_{LIM}$ ).
  - The current of  $I_{LIM}$  or more flows since the delay time of the circuit occurs during from the detection of the current limit to OFF of P-ch MOSFET.
  - Because of no potential difference at both ends of the coil, the time rate of coil current becomes quite small.
  - $Lx$  oscillates very narrow pulses by the current limit for several ms.
  - The circuit is latched, stopping its operation.

## NOTE ON USE (Continued)

15. In order to stabilize  $V_{IN}$  voltage level and oscillation frequency, we recommend that a by-pass capacitor ( $C_{IN}$ ) be connected as close as possible to the  $V_{IN}$  &  $V_{SS}$  pins.
16. High step-down ratio and very light load may lead an intermittent oscillation when PWM mode.
17. For the XCL209, when PWM/PFM automatic switching goes into continuous mode, the IC may be in unstable operation for the range of MAXDUTY area with small input/output differential. Once the design has been completed, verification with actual components should be done.
18. Torex places an importance on improving our products and their reliability.  
We request that users incorporate fail-safe designs and post-aging protection treatment when using Torex products in their systems.
19. Instructions of pattern layouts
  - (1) In order to stabilize  $V_{IN}$  voltage level, we recommend that a by-pass capacitor ( $C_{IN}$ ) be connected as close as possible to the  $V_{IN}$  (No.8) and  $PV_{SS}$  (No.1) pins.
  - (2) Please mount each external component as close to the IC as possible.
  - (3) Wire external components as close to the IC as possible and use thick, short connecting traces to reduce the circuit impedance.
  - (4) Make sure that the PCB GND traces are as thick as possible, as variations in ground potential caused by high ground currents at the time of switching may result in instability of the IC.
  - (5) Internal driver transistors bring on heat because of the output current and ON resistance of the driver transistors.
  - (6) Please connect Lx (No.2) pin and L1 (No.9) pin on the PCB layout.
  - (7) Please connect  $V_{OUT}$  (No.4) pin and L2 (No.10) pin on the PCB layout. (Type A/B)
