

General Description

The 8T49N285 has a fractional-feedback PLL that can be used as a jitter attenuator or frequency translator. It is equipped with six integer and two fractional output dividers, allowing the generation of up to 8 different output frequencies, ranging from 8kHz to 1GHz. Three of these frequencies are completely independent of each other and the inputs. The other five are related frequencies. The eight outputs may select among LVPECL, LVDS, HCSL or LVCMOS output levels.

This functionality makes it ideal to be used in any frequency translation application, including 1G, 10G, 40G and 100G Synchronous Ethernet, OTN, and SONET/SDH, including ITU-T G.709 (2009) FEC rates. The device may also behave as a frequency synthesizer.

The 8T49N285 accepts up to two differential or single-ended input clocks and a crystal input. The PLL can lock to either input clock, but both input clocks must be related in frequency.

The device supports hitless reference switching between input clocks. The device monitors both input clocks for Loss of Signal (LOS). It generates an alarm when an input clock failure is detected. Automatic and manual hitless reference switching options are supported. LOS behavior can be set to support gapped or un-gapped clocks.

The 8T49N285 supports holdover with an initial accuracy of ± 50 ppB from the point where the loss of all applicable input reference(s) has been detected. It maintains a historical average operating point that may be returned to in holdover at a limited phase slope.

The device places no constraints on input to output frequency conversion, supporting all FEC rates, including the new revision of ITU-T Recommendation G.709 (2009), most with 0ppm conversion error.

The PLL has a register-selectable loop bandwidth from 1.4Hz to 360Hz.

Each output supports individual phase delay settings to allow output-output alignment.

The device supports Output Enable inputs and Lock, Holdover and LOS status outputs.

The device is programmable through an I²C interface. It also supports I²C master capability to allow the register configuration to be read from an external EEPROM.

Applications

- OTN or SONET / SDH equipment Line cards (up to OC-192, and supporting FEC ratios)
- OTN de-mapping (Gapped Clock and DCO mode)
- Gigabit and Terabit IP switches / routers including support of Synchronous Ethernet
- SyncE (G.8262) applications
- Wireless base station baseband
- Data communications
- 100G Ethernet

Features

- Supports SDH/SONET and Synchronous Ethernet clocks including all FEC rate conversions
- <0.3ps RMS typical jitter (including spurs), 12kHz to 20MHz
- Operating modes: locked to input signal, holdover and free-run
- Initial holdover accuracy of ± 50 ppb
- Accepts two LVPECL, LVDS, LVHSTL, HCSL or LVCMOS input clocks
 - Accepts frequencies ranging from 8kHz up to 875MHz
 - Auto and manual input clock selection with hitless switching
 - Clock input monitoring, including support for gapped clocks
- Phase-Slope Limiting and Fully Hitless Switching options to control output phase transients
- Operates from a 10MHz to 40MHz fundamental-mode crystal
- Generates 8 LVPECL/LVDS/HCSL or 16 LVCMOS output clocks
 - Output frequencies ranging from 8kHz up to 1.0GHz (diff)
 - Output frequencies ranging from 8kHz to 250MHz (LVCMOS)
- Four General Purpose I/O pins with optional support for status & control:
 - Four Output Enable control inputs may be mapped to any of the eight outputs
 - Lock, Holdover & Loss-of-Signal status outputs
- Open-drain Interrupt pin
- Nine programmable PLL loop bandwidth settings from 1.4Hz to 360Hz.
 - Optional Fast Lock function
- Programmable output phase delays in steps as small as 16ps
- Register programmable through I²C or via external I²C EEPROM
- Bypass clock paths for system tests
- Power supply modes

$V_{CC} / V_{CCA} / V_{CCO}$
3.3V / 3.3V / 3.3V
3.3V / 3.3V / 2.5V
3.3V / 3.3V / 1.8V (LVCMOS)
2.5V / 2.5V / 3.3V
2.5V / 2.5V / 2.5V
2.5V / 2.5V / 1.8V (LVCMOS)
- -40°C to 85°C ambient operating temperature
- Package: 56QFN, lead-free RoHs (6)

Pin Description and Pin Characteristic Tables

Table 1. Pin Descriptions¹

Number	Name	Type		Description
3	OSCI	I		Crystal Input. Accepts a 10MHz-40MHz reference from a clock oscillator or a 12pF fundamental mode, parallel-resonant crystal.
4	OSCO	O		Crystal Output. This pin should be connected to a crystal. If an oscillator is connected to OSCI, then this pin must be left unconnected.
5	S_A0	I	Pulldown	I ² C lower address bit A0.
12	SDATA	I/O	Pullup	I ² C interface bi-directional Data.
13	SCLK	I/O	Pullup	I ² C interface bi-directional Clock.
7	CLK0	I	Pulldown	Non-inverting differential clock input.
8	nCLK0	I	Pullup / Pulldown	Inverting differential clock input. $V_{CC}/2$ when left floating (set by the internal pullup and pulldown resistors.)
9	CLK1	I	Pulldown	Non-inverting differential clock input.
10	nCLK1	I	Pullup / Pulldown	Inverting differential clock input. $V_{CC}/2$ when left floating (set by the internal pullup and pulldown resistors.)
48, 47	Q0, nQ0	O	Universal	Output Clock 0. Please refer to the “Output Drivers” section for more details.
44, 43	Q1, nQ1	O	Universal	Output Clock 1. Please refer to the “Output Drivers” section for more details.
27, 28	Q2, nQ2	O	Universal	Output Clock 2. Please refer to the “Output Drivers” section for more details.
23, 24	Q3, nQ3	O	Universal	Output Clock 3. Please refer to the “Output Drivers” section for more details.
40, 39	Q4, nQ4	O	Universal	Output Clock 4. Please refer to the “Output Drivers” section for more details.
37, 36	Q5, nQ5	O	Universal	Output Clock 5. Please refer to the “Output Drivers” section for more details.
34, 33	Q6, nQ6	O	Universal	Output Clock 6. Please refer to the “Output Drivers” section for more details.
31, 30	Q7, nQ7	O	Universal	Output Clock 7. Please refer to the “Output Drivers” section for more details.
46	nRST	I	Pullup	Master Reset input. LVTTTL / LVCMOS interface levels. 0 = All registers and state machines are reset to their default values 1 = Device runs normally
50	nINT	O	Open-drain with pullup	Interrupt output.
29, 42, 21, 25	GPIO[3:0]	I/O	Pullup	General-purpose input-outputs. LVTTTL / LVCMOS Input levels Open-drain output. Pulled-up with 5.1k Ω resistor to V_{CC} .
54	PLL_BYP	I	Pulldown	Bypass Selection. Allow input references to bypass the PLL. LVTTTL / LVCMOS interface levels
6, ePad	V_{EE}	Power		Negative supply voltage. All V_{EE} pins and ePad must be connected before any positive supply voltage is applied.
11	V_{CC}	Power		Core and digital functions supply voltage.
17	V_{CC}	Power		Core and digital functions supply voltage.
2, 14, 15, 16, 20	V_{CCA}	Power		Analog functions supply voltage for core analog functions.
1, 51, 55, 56	V_{CCA}	Power		Analog functions supply voltage for analog functions associated with PLL.
49	V_{CCO0}	Power		High-speed output supply voltage for output pair Q0, nQ0.
45	V_{CCO1}	Power		High-speed output supply voltage for output pair Q1, nQ1.
26	V_{CCO2}	Power		High-speed output supply voltage for output pair Q2, nQ2.
22	V_{CCO3}	Power		High-speed output supply voltage for output pair Q3, nQ3.
41	V_{CCO4}	Power		High-speed output supply voltage for output pair Q4, nQ4.

Table 1. Pin Descriptions¹ (Continued)

Number	Name	Type	Description
38	V _{CCO5}	Power	High-speed output supply voltage for output pair Q5, nQ5.
35	V _{CCO6}	Power	High-speed output supply voltage for output pair Q6, nQ6.
32	V _{CCO7}	Power	High-speed output supply voltage for output pair Q7, nQ7.
53 52	CAP, CAP_REF	Analog	PLL External Capacitance.
18, 19	RESERVED	Reserved	Reserved pins.

NOTE 1: *Pullup* and *Pulldown* refer to internal input resistors. See [Table 2, Pin Characteristics](#), for typical values.

NOTE 1: V_{CCOX} denotes: V_{CCO0}, V_{CCO1}, V_{CCO2}, V_{CCO3}, V_{CCO4}, V_{CCO5}, V_{CCO6}, V_{CCO7}.

NOTE 2: This specification does not apply to OSC1 and OSC0 pins.

Principles of Operation

The 8T49N285 can be locked to either of the input clocks and generate a wide range of synchronized output clocks.

It could be used for example in either the transmit or receive path of Synchronous Ethernet equipment.

The 8T49N285 accepts up to two differential input clocks ranging from 8kHz up to 875MHz. It generates up to 8 output clocks ranging from 8kHz up to 1.0GHz.

The PLL path within the 8T49N285 supports three states: Lock, Holdover and Free-run. Lock & holdover status may be monitored on register bits and pins. The PLL also supports automatic and manual hitless reference switching. In the locked state, the PLL locks to a valid clock input and its output clocks have a frequency accuracy equal to the frequency accuracy of the input clock. In the Holdover state, the PLL will output a clock which is based on the selected holdover behavior. The PLL within the 8T49N285 has an initial holdover frequency offset of ± 50 ppb. In the Free-run state, the PLL outputs a clock with the same frequency accuracy as the external crystal.

Upon power up, the PLL will enter Free-run state, in this state it generates output clocks with the same frequency accuracy as the external crystal. The 8T49N285 continuously monitors each input for activity (signal transitions).

In automatic reference switching, when an input clock has been validated the PLL will transition to the locked state. If the selected input clock fails and there are no other valid input clocks, the PLL will quickly detect that and go into holdover. In the Holdover state, the PLL will output a clock which is based on the selected holdover behavior. If the selected input clock fails and another input clock is available then the 8T49N285 will hitlessly switch to that input clock. The reference switch can be either revertive or non-revertive.

The device supports conversion of any input frequencies to three different, independent output frequencies on the Q0 and Q[2:3] outputs. Additionally, a further five output frequencies may be generated that are integer-related to the three independent frequencies. These additional five frequencies are on the Q1 and Q[4:7] outputs.

The 8T49N285 has a programmable loop bandwidth from 1.4Hz to 360Hz.

The device monitors all input clocks and generates an alarm when an input clock failure is detected.

The device supports programmable individual output phase adjustments in order to allow control of input to output phase adjustments and output to output phase alignment.

The device is programmable through an I²C and may also autonomously read its register settings from an internal One-Time Programmable (OTP) memory or an external serial I²C EEPROM.

Crystal Input

The crystal input on the 8T49N285 is capable of being driven by a parallel-resonant, fundamental mode crystal with a frequency range of 10MHz - 40MHz.

The oscillator input also supports being driven by a single-ended crystal oscillator or reference clock.

The initial holdover frequency offset is set by the device, but the long term drift depends on the quality of the crystal or oscillator attached to this port.

Bypass Path

For system test purposes, the PLL may be bypassed. When PLL_BYP is asserted the CLK0 input reference will be presented to the Q4 output dividers and the CLK1 Input reference will be presented to the Q5 output dividers.

Additionally, CLK0 or CLK1 may be used as a clock source for the output dividers of Q[4:7]. This may only be done for input frequencies of 250MHz or less.

Input Clock Selection

The 8T49N285 accepts up to two input clocks with frequencies ranging from 8kHz up to 875MHz. Each input can accept LVPECL, LVDS, LVHSTL, HCSL or LVCMOS inputs using 1.8V, 2.5V or 3.3V logic levels. To use LVCMOS inputs, refer to the Application Note, [“Wiring the Differential Input to Accept Single-Ended Levels”](#) for biasing instructions.

In Manual mode, only one of the inputs may be chosen and if that input fails the PLL will enter holdover.

Manual mode may be operated by directly selecting the desired input reference in the REFSEL register field. It may also operate via pin-selection of the desired input clock by selecting that mode in the REFSEL register field. In that case, GPIO[2] must be used as a Clock Select input (CSEL). CSEL = 0 will select the CLK0 input and CSEL = 1 will select the CLK1 input.

In addition, the crystal frequency may be passed directly to the output dividers for Q[4:7] to use as a reference.

Inputs do not support transmission of spread-spectrum clocking sources. Since this family is intended for high-performance applications, it will assume input reference sources to have stabilities of ± 100 ppm or better, except where gapped clock inputs are used.

If the PLL is working in automatic mode, then each of the input reference sources is assigned a priority of 1-2. At power-up or if the currently selected input reference fails, the PLL will switch to the highest priority input reference that is valid at that time (see [“Input Clock Monitor”](#) section for details).

Automatic mode has two sub-options: revertive or non-revertive. In revertive mode, the PLL will switch to a reference with a higher priority setting whenever one becomes valid. In non-revertive mode the PLL remains with the currently selected source as long as it remains valid.

The clock input selection is based on the input clock priority set by the Clock Input Priority control registers. It is recommended that all input references be given different priority settings in the Clock Input Priority control register.

Input Clock Monitor

Each clock input is monitored for Loss of Signal (LOS). If no activity has been detected on the clock input within a user-selectable time period then the clock input is considered to be failed and an internal Loss-of-Signal status flag is set, which may cause an input switchover depending on other settings. The user-selectable time period has sufficient range to allow a gapped clock missing many consecutive edges to be considered a valid input.

User-selection of the clock monitor time-period is based on a counter driven by a monitor clock. The monitor clock is fixed at the frequency of the PLL's VCO divided by 8. With a VCO range of 3GHz - 4GHz, the monitor clock has a frequency range of 375MHz to 500MHz.

The monitor logic for each input reference will count the number of monitor clock edges indicated in the appropriate Monitor Control register. If an edge is received on the input reference being monitored, then the count resets and begins again. If the target edge count is reached before an input reference edge is received, then an internal soft alarm is raised and the count re-starts. During the soft alarm period, the PLL tracking will not be adjusted. If an input reference edge is received before the count expires for the second time, then the soft alarm status is cleared and the PLL will resume adjustments. If the count expires again without any input reference edge being received, then a Loss-of-Signal alarm is declared.

It is expected that for normal (non-gapped) clock operation, users will set the monitor clock count for each input reference to be slightly longer than the nominal period of that input reference. A margin of 2-3 monitor clock periods should give a reasonably quick reaction time and yet prevent false alarms.

For gapped clock operation, the user will set the monitor clock count to a few monitor clock periods longer than the longest expected clock gap period. The monitor count registers support 17-bit count values, which will support at least a gap length of two clock periods for any supported input reference frequency, with longer gaps being supported for faster input reference frequencies. Since gapped clocks usually occur on input reference frequencies above 100MHz, gap lengths of thousands of periods can be supported.

Using this configuration for a gapped clock, the PLL will continue to adjust while the normally expected gap is present, but will freeze once the expected gap length has been exceeded and alarm after twice the normal gap length has passed.

Once a LOS on any of the input clocks is detected, the appropriate internal LOS alarm will be asserted and it will remain asserted until that input clock returns and is validated once 8 rising edges have been received on that input reference. If another error condition on the same input clock is detected during the validation time then the alarm remains asserted and the validation time starts over.

Each LOS flag may also be reflected on one of the GPIO[3:0] outputs. Changes in status of any reference can also generate an interrupt if not masked.

Holdover

8T49N285 supports a small initial holdover frequency offset in non-gapped clock mode. When the input clock monitor is set to support gapped clock operation, this initial holdover frequency offset is indeterminate since the desired behavior with gapped clocks is for the PLL to continue to adjust itself even if clock edges are missing. In

gapped clock mode, the PLL will not enter holdover until the input is missing for two LOS monitor periods.

The holdover performance characteristics of a clock are referred as its accuracy and stability, and are characterized in terms of the fractional frequency offset. The 8T49N285 can only control the initial frequency accuracy. Longer-term accuracy and stability are determined by the accuracy and stability of the external oscillator.

When the PLL loses all valid input references, it will enter the holdover state. In fast average mode, the PLL will initially maintain its most recent frequency offset setting and then transition at a rate dictated by its selected phase-slope limit setting to a frequency offset setting that is based on historical settings. This behavior is intended to compensate for any frequency drift that may have occurred on the input reference before it was detected to be lost.

The historical holdover value will have three options:

- Return to center of tuning range within the VCO band
- Instantaneous mode - the holdover frequency will use the DPLL current frequency 100msec before it entered holdover. The accuracy is shown in the AC Characteristics Table, [Table 11A](#).
- Fast average mode - an internal IIR (Infinite Impulse Response) filter is employed to get the frequency offset. The IIR filter gives a 3 dB attenuation point corresponding to nominal a period of 20 minutes. The accuracy is shown in the AC Characteristics Table, [Table 11A](#).

When entering holdover, the PLL will set a separate internal HOLD alarm internally. This alarm may be read from internal status register, appear on the appropriate GPIO pin and/or assert the nINT output.

While the PLL is in holdover, its frequency offset is now relative to the crystal input and so the output clocks will be tracing their accuracy to the local oscillator or crystal. At some point in time, depending on the stability & accuracy of that source, the clock(s) will have drifted outside of the limits of the holdover state and the system will be considered to be in a free-run state. Since this borderline is defined outside the PLL and dictated by the accuracy and stability of the external local crystal or oscillator, the 8T49N285 cannot know or influence when that transition occurs. As a result, the 8T49N285 will remain in the Holdover state internally.

Input to Output Clock Frequency

The 8T49N285 is designed to accept any frequency within its input range and generate eight different output frequencies that are independent from the input frequencies. The internal architecture of the device ensures that most translations will result in the exact output frequency specified. Where exact frequency translation is not possible, the frequency translation error will be minimized. Please contact IDT for configuration software or other assistance in determining if a desired configuration will be supported exactly.

Synthesizer Mode Operation

The device may also act as a frequency synthesizer with the PLL generating its operating frequency from just the crystal input. By setting the SYN_MODE register bit and setting the STATE[1:0] field to Freerun, no input clock references are required to generate the desired output frequencies.

Loop Filter and Bandwidth

When operating in Synthesizer Mode as described above, the 8T49N285 has a fixed loop bandwidth of approximately 200kHz. When Operating in all other modes, the following information applies:

The 8T49N285 uses no external components to support a range of loop bandwidths: 1.40625Hz, 2.8125Hz, 5.625Hz, 11.25Hz, 22.5Hz, 45Hz, 90Hz, 180Hz or 360Hz.

The device supports two different loop bandwidth settings: acquisition and locked. These loop bandwidths are selected from the list of options described above. If enabled, the acquisition bandwidth is used while lock is being acquired to allow the PLL to “fast-lock”. Once locked the PLL will use the locked bandwidth setting. If the acquisition bandwidth setting is not used, the PLL will use the locked bandwidth setting at all times.

Output Dividers

The 8T49N285 supports eight output dividers. Six of the output dividers will have IntN capability only (see [Table 3](#)) and the other two will support FracN division.

Integer Output Divider Programming (Q0, Q1, Q[4:7] only)

Each integer output divider block consists of two divider stages in a series to achieve the desired total output divider ratio. The first stage divider may be set to divide by 4, 5 or 6. The second stage of the divider may be bypassed (i.e. ÷1) or programmed to any even divider ratio from 2 to 131,070. The total divide ratios, settings and possible output frequencies are shown in [Table 3](#).

In addition, the first divider stage for the Q[4:7] outputs support a bypass (i.e. ÷1) operation for some clock sources.

Fractional Output Divider Programming (Q2, Q3 only)

For the FracN output dividers Q2, Q3, the output divide ratio is given by:

$$\text{Output Divide Ratio} = (N.F) \times 2$$

$$N = \text{Integer Part: } 4, 5, \dots (2^{18}-1)$$

$$F = \text{Fractional Part: } [0, 1, 2, \dots (2^{28}-1)] / (2^{28})$$

For integer operation of these output dividers, N = 3 is also supported.

Table 3. Q[0:1], Q[4:7] Output Divide Ratios

1st-Stage Divide	2nd-Stage Divide	Total Divide	Minimum F _{OUT} MHz	Maximum F _{OUT} MHz
4	1	4	750	1000
5	1	5	600	800
6	1	6	500	666.7
4	2	8	375	500
5	2	10	300	400
6	2	12	250	333.3
4	4	16	187.5	250
5	4	20	150	200
6	4	24	125	166.7
...				
4	131,070	524,280	0.0057	0.0076
5	131,070	655,350	0.0046	0.0061
6	131,070	786,420	0.0038	0.0051

NOTE: Above frequency ranges for Q[4:7] apply when driven directly from the PLL.

Output Divider Frequency Sources

Output dividers associated with the Q[0:3] outputs take their input frequency directly from the PLL.

Output dividers associated with the Q[4:7] outputs can take their input frequencies from the PLL, Q2 or Q3 output dividers, CLK0 or CLK1 input reference frequency or the crystal frequency.

Output Banks

Outputs of the 8T49N285 are divided into three banks for purposes of output skew measurement:

- Q0, nQ0, Q1, nQ1
- Q4, nQ4, Q5, nQ5
- Q6, nQ6, Q7, nQ7

Output Phase Control on Switchover

When the 8T49N285 switches between input references or enters or leaves the holdover state, there are two options on how the output phase can be controlled in these events: phase-slope limiting or fully hitless switching (sometimes called phase build-out) may be selected. The SWMODE bit selects which behavior is to be followed.

If fully hitless switching is selected, then the output phase will remain unchanged under any of these conditions. Note that fully hitless switching is not supported when external loopback is being used. Fully hitless switching should not be used unless all input references are in the same clock domain. Note that use of this mode may prevent an output frequency and phase from being able to trace its alignment back to a primary reference source.

If phase-slope limiting is selected, then the output phase will adjust from its previous value until it is tracking the new condition at a rate dictated by the SLEW[1:0] bits. Phase-slope limiting should be used if all input references are not in the same clock domain or users wish to retain traceability to a primary reference source.

Input-Output Delay Control

When using the 8T49N285 in external loopback or in a situation where input-output delay needs to be known and controlled, it is necessary to examine the exact signal path through the device. Due to the flexibility of the device, there are a large number of potential signal paths from input to output through it that depend on the desired configuration. Each of those potential paths may include or exclude logic blocks from the path and change the absolute value of the delay (Static Phase Offset or SPO) through the device. Considering the range of SPO values to cover all those potential paths would not be useful in achieving the target delays for any specific user configuration. Please contact IDT for the specific SPO value associated with a desired input-output path. Note that events such as switchovers, entering or leaving holdover or re-configuring the signal path can result in one-time changes to the SPO due to that path re-configuration. The AC Characteristics table ([Table 11A](#)) indicates the maximum variation in SPO that could be expected for a particular path through the device.

Output Phase Alignment

The device has a programmable output to output phase alignment for each of the eight output dividers. After power-up and the PLL has achieved lock, the device will be in a state where the outputs are synchronized with a deterministic offset relative to each other. After synchronization, the output alignment will depend on the particular configuration of each output according to the following rules. The step size is defined as the period of the clock to that divider:

- 1) Only outputs derived from the same source will be aligned with each other. 'Source' means the reference selected to drive the output divider as controlled by the CLK_SEL_n bit for each output.
- 2) For integer dividers (Q[0:1], Q[4:7]) when both divider stages are active, edges are aligned. This case is used as a baseline to compare the other cases here.

3) For integer dividers where the 1st-stage divider is bypassed (only Q[4:7] support this), coarse delay adjustments can't be performed. The output phase will be one step earlier than in Case 2.

4) Fractional output dividers (Q2 or Q3) do not guarantee any specific phase on power-up or after a synchronization event.

5) Integer dividers using Q2 or Q3 as a source (Q[4:7] support this option) will be aligned to their source divider's output (Q2 or Q3). Note that the output skews described above are not included in any of the phase adjustments described here.

Once the device is in operation, the outputs may have their phase adjustments re-synced in one of two ways:

- 1) If the PLL becomes unlocked, the coarse phase adjustments will be reset and the fine phase adjustments will be re-loaded once it becomes locked again.
- 2) Toggling of PLL_SYN bit may also be used to force a re-sync / re-load for the outputs.

The user may apply adjustments that are proportional to the period of the clock source each output divider is operating from. For example, if the divider associated with Output Q3 is running off the PLL, which has a VCO frequency of 4GHz, then the appropriate period would be 250ps. The output phase may be adjusted in these steps across the full period of the output.

- Coarse Adjustment: all Output Dividers may have their phase adjusted in steps of the source clock period. For example a 4GHz VCO gives a step size of 250ps. The user may request an adjustment of phase of up to 31 steps using a single register write. The phase will be adjusted by lengthening the period of the output by 250ps at a time. This process will be repeated every four output clock periods until the full requested adjustment has been achieved. A busy signal will remain asserted in the phase delay register until the requested adjustment is complete. Then a further adjustment may be setup and triggered by toggling the trigger bit.
- Fine Adjustment: For the Fractional Output Dividers associated with the Q2 and Q3 outputs, the phase of those outputs may be further adjusted with a granularity of 1/16th of the VCO period. For example a 4GHz VCO frequency gives a granularity of 16ps. This is performed by directly writing the required offset (from the nominal rising edge position) in units of 1/16th of the output period into a register. Then the PLL_SYN bit must be toggled to load the new value. Note that toggling this bit will clear all Coarse Delays for all outputs associated with the PLL, so Fine Delays should be set first. The output will then jump directly to that new offset value. For this reason, this adjustment should be made as the input is initially programmed or in High-Impedance.

Each output has the capability of being inverted (180° phase shift).

Jitter and Wander Tolerance

The 8T49N285 can be used as a line card device and therefore is expected to tolerate the jitter and wander output of a timing card PLL (e.g 82P33714).

Output Drivers

The Q[0:7] clock outputs are provided with register-controlled output drivers. By selecting the output drive type in the appropriate register, any of these outputs can support LVCMOS, LVPECL, HCSL or LVDS logic levels.

The operating voltage ranges of each output is determined by its independent output power pin (V_{CCO}) and thus each can have different output voltage levels. Output voltage levels of 2.5V or 3.3V are supported for differential operation and LVCMOS operation. In addition, the LVCMOS output operation supports 1.8V (V_{CCO}).

Each output may be enabled or disabled by register bits and/or GPIO pins configured as Output Enables. The outputs will be enabled if the register bit and the associated OE pin are both asserted (high). When disabled an output will be in a high impedance state.

LVCMOS Operation

When a given output is configured to provide LVCMOS levels, then both the Q and nQ outputs will toggle at the selected output frequency. All the previously described configuration and control apply equally to both outputs. Frequency, phase alignment, voltage levels and enable / disable status apply to both the Q and nQ pins. When LVCMOS levels are selected, the Q and nQ outputs can be selected to be phase-aligned with each other or inverted relative to one another. Phase-aligned outputs will have increased simultaneous switching currents which can negatively affect phase noise performance and power consumption. It is recommended that use of this selection be kept to a minimum.

Power-Saving Modes

To allow the device to consume the least power possible for a given application, the following functions are included under register control:

- Any unused output, including all output divider and phase adjustment logic, can be individually powered-off.
- Clock gating on logic that is not being used.

Status / Control Signals and Interrupts

General-Purpose I/Os & Interrupts

The 8T49N285 provides four General Purpose Input / Output (GPIO) pins for miscellaneous status & control functions. Each GPIO may be configured as an input or an output. Each GPIO may be directly controlled from register bits or be used as a predefined function as shown in [Table 4](#). Note that the default state prior to configuration being loaded from internal OTP or external EEPROM will be to set each GPIO to function as an Output Enable.

If used in the Fixed Function mode of operation, the GPIO bits will reflect the real-time status of their respective status bits as shown in [Table 4](#). Note that the LOL signal represents the lock status of the PLL. It does not account for the process of synchronization of the output dividers associated with that PLL. The output dividers programmed to operate from that PLL will automatically go through a re-synchronization process when the PLL locks or re-locks or if the user triggers a re-sync manually via register bit PLL_SYN. This synchronization process may result in a period of instability on the affected outputs for a duration of up to 350ns after the re-lock (LOL de-asserts) or the PLL_SYN bit is de-asserted.

Table 4. GPIO Configuration

GPIO Pin	Configured as Input			Configured as Output		
	Fixed Function			General Purpose	Fixed Function	General Purpose
	Output Enable (default)	Output Enable	Clock Select			
3	OE[3]	OE[7]	-	GPI[3]	LOS[1]	GPO[3]
2	OE[2]	OE[6]	CSEL	GPI[2]	LOS[0]	GPO[2]
1	OE[1]	OE[5]	-	GPI[1]	HOLD	GPO[1]
0	OE[0]	OE[4]	-	GPI[0]	LOL	GPO[0]

Interrupt Functionality

Interrupt functionality includes an interrupt status flag for the PLL Loss-of-Lock Status (LOL), PLL Holdover Status (HOLD) and Input Reference Status (LOS[1:0]) that is set whenever there is an alarm on any of those signals. The Status Flag will remain set until the alarm has been cleared and a '1' has been written to the Status Flag's register location or if a reset occurs. Each Status Flag will also have an Interrupt Enable bit that will determine if that Status Flag is allowed to cause the Interrupt Status to be affected (enabled) or not (disabled). All Interrupt Enable bits will be in the disabled state after reset. The Device Interrupt Status flag and nINT output pin are asserted if any of the enabled Interrupt Status flags are set.

Device Hardware Configuration

The 8T49N285 supports an internal One-Time Programmable (OTP) memory that can be pre-programmed at the factory with one complete device configuration. If the device is set to read a configuration from an external, serial EEPROM, then the values read will overwrite the OTP-defined values.

This configuration can be over-written using the serial interface once reset is complete. Any configuration written via the programming interface needs to be re-written after any power cycle or reset. Please contact IDT if a specific factory-programmed configuration is desired.

Device Start-up & Reset Behavior

The 8T49N285 has an internal power-up reset (POR) circuit and a Master Reset input pin nRST. If either is asserted, the device will be in the Reset State.

For highly programmable devices, it's common practice to reset the device immediately after the initial power-on sequence. IDT recommends connecting the nRST input pin to a programmable logic source for optimal functionality. It is recommended that a minimum pulse width of 10ns be used to drive the nRST input pin.

While in the reset state (nRST input asserted or POR active), the device will operate as follows:

- All registers will return to & be held in their default states as indicated in the applicable register description.
- All internal state machines will be in their reset conditions.
- The serial interface will not respond to read or write cycles.
- The GPIO signals will be configured as OE[3:0] inputs.
- All clock outputs will be disabled.
- All interrupt status and Interrupt Enable bits will be cleared, negating the nINT signal.

Upon the latter of the internal POR circuit expiring or the nRST input negating, the device will exit reset and begin self-configuration.

The device will load an initial block of its internal registers using the configuration stored in the internal One-Time Programmable (OTP) memory. Once this step is complete, the 8T49N285 will check the register settings to see if it should load the remainder of its configuration from an external I²C EEPROM at a defined address or continue loading from OTP. See the section on ["I²C Boot-up Initialization Mode"](#) for details on how this is performed.

Once the full configuration has been loaded, the device will respond to accesses on the serial port and will attempt to lock the PLL to the selected source and begin operation. Once the PLL is locked, all the outputs derived from it will be synchronized and output phase adjustments can then be applied if desired.

Serial Control Port Description

Serial Control Port Configuration Description

The device has a serial control port capable of responding as a slave in an I²C compatible configuration to allow access to any of the internal registers for device programming or examination of internal status. All registers are configured to have default values. See the specifics for each register for details.

The device has the additional capability of becoming a master on the I²C bus only for the purpose of reading its initial register configurations from a serial EEPROM on the I²C bus. Writing of the configuration to the serial EEPROM must be performed by another device on the same I²C bus or pre-programmed into the device prior to assembly.

I²C Mode Operation

The I²C interface is designed to fully support v1.2 of the I²C Specification for Normal and Fast mode operations. The device acts as a slave device on the I²C bus at 100kHz or 400kHz using the address defined in the Serial Interface Control register (0006h), as modified by the S_A0 input pin setting. The interface accepts byte-oriented block write and block read operations. Two address bytes specify the register address of the byte position of the first register to write or read. Data bytes (registers) are accessed in sequential order from the lowest to the highest byte (most significant bit first). Read and write block transfers can be stopped after any complete byte transfer. During a write operation, data will not be moved into the registers until the STOP bit is received, at which point, all data received in the block write will be written simultaneously.

For full electrical I²C compliance, it is recommended to use external pull-up resistors for SDATA and SCLK. The internal pull-up resistors have a size of 51kΩ typical.

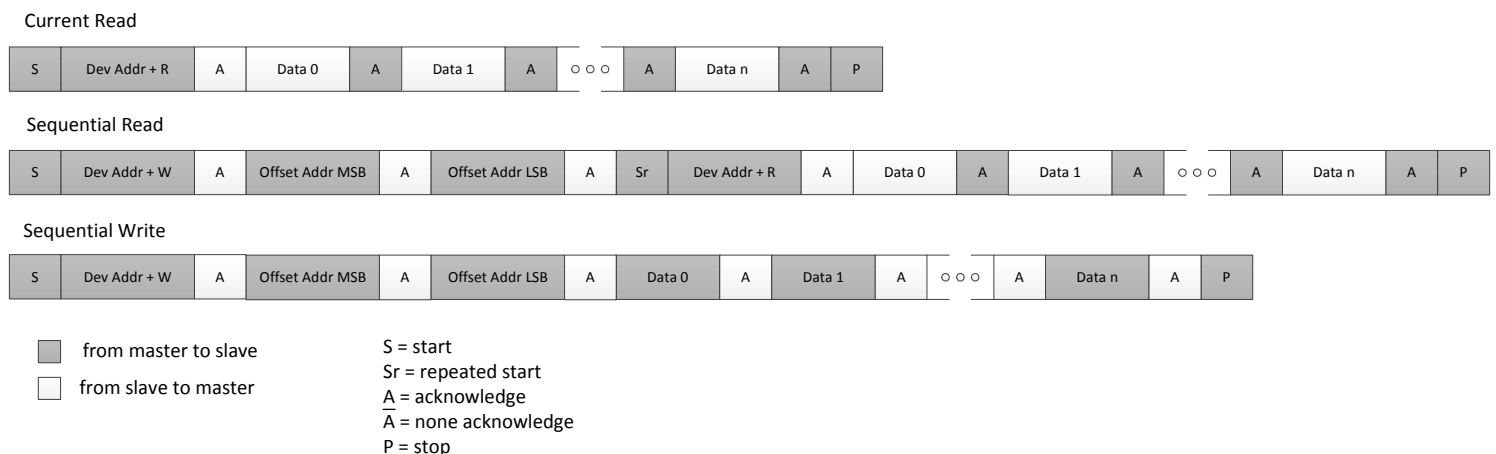

Figure 3. I²C Slave Read and Write Cycle Sequencing

I²C Master Mode

When operating in I²C mode, the 8T49N285 has the capability to become a bus master on the I²C bus for the purposes of reading its configuration from an external I²C EEPROM. Only a block read cycle will be supported.

As an I²C bus master, the 8T49N285 will support the following functions:

- 7-bit addressing mode
- Base address register for EEPROM
- Validation of the read block via CCITT-8 CRC check against value stored in last byte (E0h) of EEPROM
- Support for 100kHz and 400kHz operation with speed negotiation. If bit d0 is set at Byte address 05h in the EEPROM, this will shift from 100kHz operation to 400kHz operation.
- Support for 1- or 2-byte addressing mode
- Master arbitration with programmable number of retries

- Fixed-period cycle response timer to prevent permanently hanging the I²C bus.
- Read will abort with an alarm (BOOTFAIL) if any of the following conditions occur: Slave NACK, Arbitration Fail, Collision during Address Phase, CRC failure, Slave Response time-out

The 8T49N285 will not support the following functions:

- I²C General Call
- Slave clock stretching
- I²C Start Byte protocol
- EEPROM Chaining
- CBUS compatibility
- Responding to its own slave address when acting as a master
- Writing to external I²C devices including the external EEPROM used for booting

Sequential Read (1-byte offset address)

Sequential Read (2-byte offset address)

- | | | |
|--|----------------------|-----------------------|
|  | from master to slave | S = start |
|  | from slave to master | Sr = repeated start |
| | | A = acknowledge |
| | | A̅ = none acknowledge |
| | | P = stop |

Figure 4. I²C Master Read Cycle Sequencing

I²C Boot-up Initialization Mode

If enabled (via the BOOT_EEP bit in the Startup register), once the nRST input has been deasserted (high) and its internal power-up reset sequence has completed, the device will contend for ownership of the I²C bus to read its initial register settings from a memory location on the I²C bus. The address of that memory location is kept in non-volatile memory in the Startup register. During the boot-up process, the device will not respond to serial control port accesses. Once the initialization process is complete, the contents of any of the device's registers can be altered. It is the responsibility of the user to make any desired adjustments in initial values directly in the serial bus memory.

If a NACK is received to any of the read cycles performed by the device during the initialization process, or if the CRC does not match the one stored in address E0h of the EEPROM the process will be aborted and any uninitialized registers will remain with their default values. The BOOTFAIL bit (021Eh) in the Global Interrupt Status register will also be set in this event.

If the BOOTFAIL bit is set, then the LOL indicator will be set.

Contents of the EEPROM should be as shown in [Table 5](#).

Table 5. External Serial EEPROM Contents

EEPROM Offset (Hex)	Contents							
	D7	D6	D5	D4	D3	D2	D1	D0

Output Divider Control Register Block Field Descriptions			
Bit Field Name	Field Type	Default Value	Description
NS1_Qm[1:0] (m = 0,1)	R/W	10b	1st Stage Output Divider Ratio for Output Clock Qm, nQm (m = 0, 1): 00 = /5 01 = /6 10 = /4 11 = Output Qm, nQm not switching
NS1_Qm[1:0] (m = 4, 5, 6, 7)	R/W	10b	1st Stage Output Divider Ratio for Output Clock Qm, nQm (m = 4, 5, 6, 7): 00 = /5 01 = /6 10 = /4 11 = /1 (Do not use this selection if PLL is the source since the 2nd-stage divider has a limit of 1GHz).
NS2_Qm[15:0]	R/W	0002h	2nd Stage Output Divider Ratio for Output Clock Qm, nQm (m = 0, 1, 4, 5, 6, 7). Actual divider ratio is 2x the value written here. A value of 0 in this register will bypass the second stage of the divider.
N_Qm[17:0]	R/W	00008h	Integer Portion of Output Divider Ratio for Output Clock Qm, nQm (m = 2, 3). Values of 0, 1 or 2 cannot be written to this register. Actual divider ratio is 2x the value written here.
NFRAC_Qm[27:0]	R/W	0000000h	Fractional Portion of Output Divider Ratio for Output Clock Qm, nQm (m = 2, 3). Actual fractional portion is 2x the value written here. Fraction = (NFRAC_Qm * 2) * 2 ⁻²⁸
Rsvd	R/W	-	Reserved. Always write 0 to this bit location. Read values are not defined.

Table 6J. Output Clock Phase Adjustment Control Register Bit Field Locations and Descriptions

Output Clock Phase Adjustment Control Register Block Field Locations

00A6		Rsvd				FINE2[3:0]		
00A7		Rsvd				FINE3[3:0]		

Output Clock Phase Adjustment Control Register Block Field Descriptions			
Bit Field Name	Field Type	Default Value	Description
CRSE_TRG[7:0]	R/W	00h	Trigger Coarse Phase Adjustment for output Qm, nQm by amount specified in COARSEm[4:0] register upon 0→1 transition of this Trigger register bit. Please ensure the PA_BUSYm status bit is 0 before triggering another adjustment cycle on that particular output. Trigger bit must be returned to 0 before another delay cycle can be triggered.
COARSEm[4:0]	R/W	00000b	Number of periods to be inserted when Trigger happens. Relevant clock period is determined by the clock source selected for output Qm, nQm in its CLK_SELm register field.
FINEm[3:0]	R/W	0000b	Number of 1/16th's of the relevant clock period to add to the phase of output Qm, nQm (m = 2, 3). Relevant clock period is determined by the clock source selected for output Qm, nQm in its CLK_SELm register field. The PLL_SYN bit for the PLL driving the output divider for the output in question must be toggled to make this value take effect. Note that toggling the PLL_SYN bit will clear all Coarse delay values and so Fine delay should be set first.
Rsvd	R/W	-	Reserved. Always write 0 to this bit location. Read values are not defined.

Table 6K. Output Clock Source Control Register Bit Field Locations and Descriptions

Output Clock Source Control Register Block Field Locations

00AB	11		11		Rsvd		Rsvd	

Output Clock Source Control Register Block Field Descriptions			
Bit Field Name	Field Type	Default Value	Description
PLL_SYN	R/W	0b	Output Synchronization Control for Outputs Derived from PLL: Setting this bit from 0→1 will cause the output divider(s) for the affected outputs to be held in reset. Setting this bit from 1→0 will release all the output divider(s) for the affected outputs to run from the same point in time with the coarse output phase adjustment reset to 0.
CLK_SEL4[2:0]	R/W	000b	Clock Source Selection for output Q4, nQ4. Do not select Input Reference 0 or 1 if that input is faster than 250MHz. 000 = PLL 001 = Reserved 010 = Output Q2, nQ2 011 = Output Q3, nQ3 100 = Input Reference 0 (CLK0) 101 = Input Reference 1 (CLK1) 110 = Reserved 111 = Crystal Input
CLK_SEL5[2:0]	R/W	010b	Clock Source Selection for output Q5, nQ5. Do not select Input Reference 0 or 1 if that input is faster than 250MHz. 000 = PLL 001 = Reserved 010 = Output Q2, nQ2 011 = Output Q3, nQ3 100 = Input Reference 0 (CLK0) 101 = Input Reference 1 (CLK1) 110 = Reserved 111 = Crystal Input
CLK_SEL6[2:0]	R/W	000b	Clock Source Selection for output Q6, nQ6. Do not select Input Reference 0 or 1 if that input is faster than 250MHz. 000 = PLL 001 = Reserved 010 = Output Q2, nQ2 011 = Output Q3, nQ3 100 = Input Reference 0 (CLK0) 101 = Input Reference 1 (CLK1) 110 = Reserved 111 = Crystal Input
CLK_SEL7[2:0]	R/W	101b	Clock Source Selection for output Q7, nQ7. Do not select Input Reference 0 or 1 if that input is faster than 250MHz. 000 = PLL 001 = Reserved 010 = Output Q2, nQ2 011 = Output Q3, nQ3 100 = Input Reference 0 (CLK0) 101 = Input Reference 1 (CLK1) 110 = Reserved 111 = Crystal Input
Rsvd	R/W	-	Reserved. Always write 0 to this bit location. Read values are not defined.

Table 6L. Analog PLL Control Register Bit Field Locations and Descriptions

Please contact IDT through one of the methods listed on the last page of this datasheet for details on how to set these fields for a particular user configuration.

Analog PLL Control Register Block Field Locations								
Address (Hex)	D7	D6	D5	D4	D3	D2	D1	D0

Table 6Q. Interrupt Status Register Bit Field Locations and Descriptions

This register contains sticky bits for tracking the status of the various alarms. Whenever an alarm occurs, the appropriate Interrupt Status bit will be set. The Interrupt Status bit will remain asserted even after the original alarm goes away. The Interrupt Status bits remain asserted until explicitly cleared by a write of a '1' to the bit over the serial port. This type of functionality is referred to as Read / Write-1-to-Clear (R/W1C).

Interrupt Status Register Block Field Locations								
Address (Hex)	D7	D6	D5	D4	D3	D2	D1	D0

Global Interrupt Status Register Block Field Descriptions			
Bit Field Name	Field Type	Default Value	Description
INT	R/O	-	Device Interrupt Status: 0 = No Interrupt Status bits that are enabled are asserted (nINT pin released) 1 = At least one Interrupt Status bit that is enabled is asserted (nINT pin asserted low)
BOOTFAIL	R/O	-	Reading of Serial EEPROM failed. Once set this bit is only cleared by reset.
nEEP_CRC	R/O	-	EEPROM CRC Error (Active Low): 0 = EEPROM was detected and read, but CRC check failed - please reset the device via the nRST pin to retry (serial port is locked) 1 = No EEPROM CRC Error
EEPDONE	R/O	-	Serial EEPROM Read cycle has completed. Once set this bit is only cleared by reset.
Rsvd	R/W	-	Reserved. Always write 0 to this bit location. Read values are not defined.

Absolute Maximum Ratings

NOTE: Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These ratings are stress specifications only. Functional operation of the product at these conditions or any conditions beyond those listed in the *DC Characteristics* or *AC Characteristics* is not implied. Exposure to absolute maximum rating conditions for extended periods may affect product reliability.

Item	Rating
Supply Voltage, V_{CC}	3.63V
Inputs, V_I OSCI Other Input	0V to 2V -0.5V to $V_{CC} + 0.5V$
Outputs, V_O , (Q[0:7], nQ[0:7])	-0.5V to $V_{CCOX} + 0.5V$
Outputs, V_O , (GPIO[3:0], SDATA, SCLK, nINT)	-0.5V to $V_{CC} + 0.5V$
Outputs, I_O (Q[7:0], nQ[7:0]) Continuous Current Surge Current	40mA 65mA
Outputs, I_O (GPIO[3:0], SDATA, SCLK, nINT) Continuous Current Surge Current	8mA 13mA
Junction Temperature, T_J	125°C
Storage Temperature, T_{STG}	-65°C to 150°C

NOTE: V_{CCOX} denotes V_{CC00} , V_{CC01} , V_{CC02} , V_{CC03} , V_{CC04} , V_{CC05} , V_{CC06} , V_{CC07} .

Supply Voltage Characteristics

Table 7A. Power Supply Characteristics, $V_{CC} = 3.3V \pm 5\%$, $V_{EE} = 0V$, $T_A = -40^\circ C$ to $85^\circ C$

Symbol	Parameter	Test Conditions	Minimum	Typical	Maximum	Units
V_{CC}	Core Supply Voltage		3.135	3.3	3.465	V
V_{CCA}	Analog Supply Voltage		$V_{CC} - 0.09$	3.3	V_{CC}	V
I_{CC}	Power Supply Current ¹			64	90	mA
I_{CCA}	Analog Supply Current ¹			122	187	mA
I_{EE}	Power Supply Current ²	Q[0:7] Configured for LVPECL Logic Levels; Outputs Unloaded		468	630	mA

NOTE 1: I_{CC} and I_{CCA} are included in I_{EE} when Q[0:7] is configured for LVPECL logic levels.

NOTE 2: Internal dynamic switching current at maximum f_{OUT} is included.

Table 7B. Power Supply Characteristics, $V_{CC} = 2.5V \pm 5\%$, $V_{EE} = 0V$, $T_A = -40^\circ C$ to $85^\circ C$

Symbol	Parameter	Test Conditions	Minimum	Typical	Maximum	Units
V_{CC}	Core Supply Voltage		2.375	2.5	2.625	V
V_{CCA}	Analog Supply Voltage		$V_{CC} - 0.09$	2.5	V_{CC}	V
I_{CC}	Power Supply Current ¹			63	85	mA
I_{CCA}	Analog Supply Current ¹			119	182	mA
I_{EE}	Power Supply Current ²	Q[0:7] Configured for LVPECL Logic Levels; Outputs Unloaded		441	595	mA

NOTE 1: I_{CC} and I_{CCA} are included in I_{EE} when Q[0:7] is configured for LVPECL logic levels.

NOTE 2: Internal dynamic switching current at maximum f_{OUT} is included.

Table 7C. Maximum Output Supply Current, $V_{CC} = 3.3V \pm 5\%$ or $2.5V \pm 5\%$, $V_{EE} = 0V$, $T_A = -40^\circ C$ to $85^\circ C$ ¹

Symbol	Parameter	Test Conditions	$V_{CC0x}^2 = 3.3V \pm 5\%$				$V_{CC0x}^2 = 2.5V \pm 5\%$				$V_{CC0x}^2 = 1.8V \pm 5\%$	Units
			LVPECL	LVDS	HCSL	LVC MOS	LVPECL	LVDS	HCSL	LVC MOS	LVC MOS	
I_{CC00}	Q0, nQ0 Output Supply Current	Outputs Unloaded	50	60	50	55	40	50	40	45	35	mA
I_{CC01}	Q1, nQ1 Output Supply Current	Outputs Unloaded	50	60	50	55	40	50	40	45	35	mA
I_{CC02}	Q2, nQ2 Output Supply Current	Outputs Unloaded	80	90	80	80	70	80	70	70	60	mA

I_{CC05}	Q5, nQ5 Output Supply Current	Outputs Unloaded	55	65	55	55	45	55	45	45	40	mA
I_{CC06}	Q6, nQ6 Output Supply Current	Outputs Unloaded	55	65	55	55	45	55	45	45	40	mA
I_{CC07}	Q7, nQ7 Output Supply Current	Outputs Unloaded	55	65	55	55	45	55	45	45	40	mA

NOTE 1: Internal dynamic switching current at maximum f_{OUT} is included.

NOTE 2: V_{CC0x} denotes V_{CC00} , V_{CC01} , V_{CC02} , V_{CC03} , V_{CC04} , V_{CC05} , V_{CC06} , V_{CC07} .

DC Electrical Characteristics

Table 8A. LVCMOS/LVTTL DC Characteristics, $V_{EE} = 0V$, $T_A = -40^{\circ}C$ to $85^{\circ}C$

Symbol	Parameter		Test Conditions	Minimum	Typical	Maximum	Units
V_{IH}	Input High Voltage		$V_{CC} = 3.3V$	2		$V_{CC} + 0.3$	V
			$V_{CC} = 2.5V$	1.7		$V_{CC} + 0.3$	V
V_{IL}	Input Low Voltage		$V_{CC} = 3.3V$	-0.3		0.8	V
			$V_{CC} = 2.5V$	-0.3		0.7	V
I_{IH}	Input High Current	PLL_BYP, S_A0	$V_{CC} = V_{IN} = 3.465V$ or $2.625V$			150	μA
		nRST, SDATA, SCLK	$V_{CC} = V_{IN} = 3.465V$ or $2.625V$			5	μA
		GPIO[3:0]	$V_{CC} = V_{IN} = 3.465V$ or $2.625V$			1	mA
I_{IL}	Input Low Current	PLL_BYP, S_A0	$V_{CC} = 3.465V$ or $2.625V$, $V_{IN} = 0V$	-5			μA
		nRST, SDATA, SCLK	$V_{CC} = 3.465V$ or $2.625V$, $V_{IN} = 0V$	-150			μA
		GPIO[3:0]	$V_{CC} = 3.465V$ or $2.625V$, $V_{IN} = 0V$	-1			mA
V_{OH}	Output High Voltage	nINT, SDATA, SCLK ¹	$V_{CC} = 3.3V \pm 5\%$, $I_{OH} = -5\mu A$	2.6			V
		GPIO[3:0]	$V_{CC} = 3.3V \pm 5\%$, $I_{OH} = -50\mu A$	2.6			V
		nINT, SDATA, SCLK ¹	$V_{CC} = 2.5V \pm 5\%$, $I_{OH} = -5\mu A$	1.8			V
		GPIO[3:0]	$V_{CC} = 2.5V \pm 5\%$, $I_{OH} = -50\mu A$	1.8			V
V_{OL}	Output Low Voltage	nINT, SDATA, SCLK ¹	$V_{CC} = 3.3V \pm 5\%$ or $2.5V \pm 5\%$, $I_{OL} = 5mA$			0.5	V
		GPIO[3:0]	$V_{CC} = 3.3V \pm 5\%$ or $2.5V \pm 5\%$, $I_{OL} = 50\mu A$			0.5	V

NOTE 1: Use of external pull-up resistors is recommend.

Table 8B. Differential Input DC Characteristics, $V_{CC} = V_{CCOX} = 3.3V \pm 5\%$ or $2.5V \pm 5\%$, $V_{EE} = 0V$, $T_A = -40^{\circ}C$ to $85^{\circ}C$ ^{1 2}

Symbol	Parameter		Test Conditions	Minimum	Typical	Maximum	Units
I_{IH}	Input High Current	CLKx, nCLKx	$V_{CC} = V_{IN} = 3.465V$ or $2.625V$			150	μA
I_{IL}	Input Low Current	CLKx	$V_{CC} = 3.465V$ or $2.625V$, $V_{IN} = 0V$	-5			μA
		nCLKx	$V_{CC} = 3.465V$ or $2.625V$, $V_{IN} = 0V$	-150			μA
V_{PP}	Peak-to-Peak Voltage ³			0.15		1.3	V
V_{CMR}	Common Mode Input Voltage ^{3, 4}			V_{EE}		$V_{CC} - 1.2$	V

NOTE 1: CLKx denotes CLK0, CLK1. nCLKx denotes nCLK0, nCLK1.

NOTE 2: V_{CCOX} denotes V_{CCO0} , V_{CCO1} , V_{CCO2} , V_{CCO3} , V_{CCO4} , V_{CCO5} , V_{CCO6} , V_{CCO7} .

NOTE 3: V_{IL} should not be less than -0.3V. V_{IH} should not be higher than V_{CC} .

NOTE 4: Common mode voltage is defined as the cross-point.

Table 8C. LVPECL DC Characteristics, $V_{CC} = 3.3V \pm 5\%$ or $2.5V \pm 5\%$, $V_{CCOX} = 3.3V \pm 5\%$ or $2.5V \pm 5\%$, $V_{EE} = 0V$, $T_A = -40^\circ C$ to $85^\circ C$ ^{1, 2}

Symbol	Parameter	Test Conditions	$V_{CCOX} = 3.3V \pm 5\%$			$V_{CCOX} = 2.5V \pm 5\%$			Units
			Minimum	Typical	Maximum	Minimum	Typical	Maximum	
V_{OH}	Output High Voltage ³	Q_x, nQ_x	$V_{CCOX} - 1.3$		$V_{CCOX} - 0.8$	$V_{CCOX} - 1.4$		$V_{CCOX} - 0.9$	V
V_{OL}	Output Low Voltage ³	Q_x, nQ_x	$V_{CCOX} - 1.95$		$V_{CCOX} - 1.75$	$V_{CCOX} - 1.95$		$V_{CCOX} - 1.75$	V

NOTE 1: V_{CCOX} denotes $V_{CC00}, V_{CC01}, V_{CC02}, V_{CC03}, V_{CC04}, V_{CC05}, V_{CC06}, V_{CC07}$.

NOTE 2: Q_x denotes $Q0, Q1, Q2, Q3, Q4, Q5, Q6, Q7$. nQ_x denotes $nQ0, nQ1, nQ2, nQ3, nQ4, nQ5, nQ6, nQ7$.

NOTE 3: Outputs terminated with 50Ω to $V_{CCOX} - 2V$.

Table 8D. LVDS DC Characteristics, $V_{CC} = 3.3V \pm 5\%$ or $2.5V \pm 5\%$, $V_{CCOX} = 3.3V \pm 5\%$ or $2.5V \pm 5\%$, $V_{EE} = 0V$, $T_A = -40^\circ C$ to $85^\circ C$ ^{1, 2, 3}

Symbol	Parameter	Test Conditions	Minimum	Typical	Maximum	Units
V_{OD}	Differential Output Voltage	Q_x, nQ_x	195		454	mV
ΔV_{OD}	V_{OD} Magnitude Change	Q_x, nQ_x			50	mV
V_{OS}	Offset Voltage	Q_x, nQ_x	1.1		1.375	V
ΔV_{OS}	V_{OS} Magnitude Change	Q_x, nQ_x			50	mV

NOTE 1: V_{CCOX} denotes $V_{CC00}, V_{CC01}, V_{CC02}, V_{CC03}, V_{CC04}, V_{CC05}, V_{CC06}, V_{CC07}$.

NOTE 2: Q_x denotes $Q0, Q1, Q2, Q3, Q4, Q5, Q6, Q7$. nQ_x denotes $nQ0, nQ1, nQ2, nQ3, nQ4, nQ5, nQ6, nQ7$.

NOTE 3: Terminated 100Ω across Q_x and nQ_x .

Table 8E. LVCMOS DC Characteristics, $V_{CC} = 3.3V \pm 5\%$ or $2.5V \pm 5\%$, $V_{EE} = 0V$, $T_A = -40^\circ C$ to $85^\circ C$ ^{1, 2}

Symbol	Parameter	Test Conditions	$V_{CCOX} = 3.3V \pm 5\%$			$V_{CCOX} = 2.5V \pm 5\%$			$V_{CCOX} = 1.8V \pm 5\%$			Units
			Minimum	Typical	Maximum	Minimum	Typical	Maximum	Minimum	Typical	Maximum	
V_{OH}	Output High Voltage	Q_x, nQ_x	$I_{OH} = -8mA$	2.6		1.8			1.1			V
V_{OL}	Output Low Voltage	Q_x, nQ_x	$I_{OL} = 8mA$		0.5			0.5			0.5	V

NOTE 1: V_{CCOX} denotes $V_{CC00}, V_{CC01}, V_{CC02}, V_{CC03}, V_{CC04}, V_{CC05}, V_{CC06}, V_{CC07}$.

NOTE 2: Q_x denotes $Q0, Q1, Q2, Q3, Q4, Q5, Q6, Q7$. nQ_x denotes $nQ0, nQ1, nQ2, nQ3, nQ4, nQ5, nQ6, nQ7$.

Table 9. Input Frequency Characteristics, $V_{CC} = 3.3V \pm 5\%$ or $2.5V \pm 5\%$, $T_A = -40^\circ C$ to $85^\circ C$ ¹

Symbol	Parameter		Test Conditions	Minimum	Typical	Maximum	Units
f_{IN}	Input Frequency ²	OSCI, OSCO	Using a Crystal (See Table 10 , Crystal Characteristics)	10		40	MHz
			Overdriving Crystal Input, Doubler Logic Enabled ³	10		62.5	MHz
			Overdriving Crystal Input, Doubler Logic Disabled ³	16		125	MHz
		CLKx, nCLKx		0.008		875	MHz
f_{SCLK}	Serial Port Clock	SCLK	Slave Mode	100		400	kHz

NOTE 1: CLKx denotes CLK0, CLK1. nCLKx denotes nCLK0, nCLK1.

NOTE 2: For the input reference frequency, the divider values must be set for the VCO to operate within its supported range.

NOTE 3: For optimal noise performance, the use of a quartz crystal is recommended. Refer to Applications Information, [“Overdriving the XTAL Interface”](#).

Table 10. Crystal Characteristics

Parameter	Test Conditions	Minimum	Typical	Maximum	Units
Mode of Oscillation		Fundamental			
Frequency		10		40	MHz
Equivalent Series Resistance (ESR)			15		Ω
Load Capacitance (C_L)			12		pF
Frequency Stability (total)		-100		100	ppm

AC Electrical Characteristics

Table 11A. AC Characteristics, $V_{CC} = 3.3V \pm 5\%$ or $2.5V \pm 5\%$, $V_{CCOx} = 3.3V \pm 5\%$, $2.5V \pm 5\%$ or $1.8V \pm 5\%$ (1.8V only supported for LVCMOS outputs), $T_A = -40^\circ C$ to $85^\circ C$ ^{1, 2}

ΔSPO	Static Phase Offset Variation ¹⁹		f _{IN} = f _{OUT} = 156.25 MHz	-175		175	ps

NOTE 1: V_{CCOx} denotes V_{CCO0} , V_{CCO1} , V_{CCO2} , V_{CCO3} , V_{CCO4} , V_{CCO5} , V_{CCO6} , V_{CCO7} .

NOTE 2: Electrical parameters are guaranteed over the specified ambient operating temperature range, which is established when the device is mounted in a test socket with maintained transverse airflow greater than 500 lpm. The device will meet specifications after thermal equilibrium has been reached under these conditions.

NOTE 3: Appropriate SE_MODE bit must be configured to select phase-aligned or phase-inverted operation.

NOTE 4: All Q and nQ outputs in phase-inverted operation.

NOTE 5: Measured from -150mV to +150mV on the differential waveform (derived from Qx minus nQx). The signal must be monotonic through the measurement region for rise and fall time. The 300mV measurement window is centered on the differential zero crossing.

NOTE 6: This parameter is guaranteed by characterization. Not tested in production.

NOTE 7: This parameter is defined in accordance with JEDEC Standard 65.

NOTE 8: Measured at the output differential cross point.

NOTE 9: Defined as skew within a bank of outputs at the same supply voltage and with equal load conditions.

NOTE 10: Measured at $V_{CCOx}/2$ of the rising edge. All Qx and nQx outputs phase-aligned.

NOTE 11: Characterized in synthesizer mode. Duty cycle of bypassed signals (input reference clocks or crystal input) is not adjusted by the device.

NOTE 12: Tested in fast-lock operation after >20 minutes of locked operation to ensure holdover averaging logic is stable.

NOTE 13: This parameter is guaranteed by design.

NOTE 14: Using internal feedback mode configuration.

NOTE 15: Device programmed with SWMODEn = 0 (absorbs phase differences).

NOTE 16: Characterized with 8T49N285-901 units (synthesizer mode).

NOTE 17: Tested with all outputs operating at 122.88MHz.

NOTE 18: Assuming a clear I^2C bus.

NOTE 19: This parameter was measured using CLK0 as the reference input and CLK1 as the external feedback input. Characterized with 8T49N285-908.

Table 11B. HCSL AC Characteristics, $V_{CC} = 3.3V \pm 5\%$ or $2.5V \pm 5\%$, $V_{CCOx} = 3.3V \pm 5\%$ or $2.5V \pm 5\%$, $T_A = -40^\circ C$ to $85^\circ C$ ¹

Symbol	Parameter	Test Conditions	Minimum	Typical	Maximum	Units
V_{RB}	Ring-back Voltage Margin ^{2, 3}		-100		100	mV
t_{STABLE}	Time before V_{RB} is allowed ^{2, 3}		500			ps
V_{MAX}	Absolute Max. Output Voltage ^{4, 5}				1150	mV
V_{MIN}	Absolute Min. Output Voltage ^{4, 6}		-300			mV
V_{CROSS}	Absolute Crossing Voltage ^{7, 8}		230		550	mV
ΔV_{CROSS}	Total Variation of V_{CROSS} Over all Edges ^{7, 9}				140	mV

NOTE 1: Electrical parameters are guaranteed over the specified ambient operating temperature range, which is established when the device is mounted in a test socket with maintained transverse airflow greater than 500 lfpm. The device will meet specifications after thermal equilibrium has been reached under these conditions.

NOTE 2: Measurement taken from differential waveform.

NOTE 3: T_{STABLE} is the time the differential clock must maintain a minimum $\pm 150mV$ differential voltage after rising/falling edges before it is allowed to drop back into the $V_{RB} \pm 100mV$ differential range.

NOTE 4: Measurement taken from single ended waveform.

NOTE 5: Defined as the maximum instantaneous voltage including overshoot.

NOTE 6: Defined as the minimum instantaneous voltage including overshoot

NOTE 7: Measured at crossing point where the instantaneous voltage value of the rising edge of Qn equals the falling edge of nQn.

NOTE 8: Refers to the total variation from the lowest crossing point to the highest, regardless of which edge is crossing. Refers to all crossing points for this measurement.

NOTE 9: Defined as the total variation of all crossing voltages of rising Qn and falling nQn. This is the maximum allowed variance in V_{CROSS} for any particular system.

t_{REFCLK_RMS} (PCIe Gen 3)	Phase Jitter RMS ^{4, 5, 7}	$f = 100MHz$, 40MHz Crystal Input, Evaluation Band: 0Hz - Nyquist (clock frequency/2)		0.2	0.5	0.8	ps

NOTE 1: V_{CCOx} denotes V_{CCO0} , V_{CCO1} , V_{CCO2} , V_{CCO3} , V_{CCO4} , V_{CCO5} , V_{CCO6} , V_{CCO7} .

NOTE 2: Electrical parameters are guaranteed over the specified ambient operating temperature range, which is established when the device is mounted in a test socket with maintained transverse airflow greater than 500 lfm. The device will meet specifications after thermal equilibrium has been reached under these conditions.

NOTE 3: Peak-to-Peak jitter after applying system transfer function for the Common Clock Architecture. Maximum limit for PCI Express Gen 1.

NOTE 4: This parameter is guaranteed by characterization. Not tested in production

NOTE 5: Outputs configured for HCSL mode. Fox 277LF-40-18 crystal used with doubler logic enabled.

NOTE 6: RMS jitter after applying the two evaluation bands to the two transfer functions defined in the Common Clock Architecture and reporting the worst case results for each evaluation band. Maximum limit for PCI Express Generation 2 is 3.1ps RMS for $t_{REFCLK_HF_RMS}$ (High Band) and 3.0ps RMS for $t_{REFCLK_LF_RMS}$ (Low Band).

NOTE 7: RMS jitter after applying system transfer function for the common clock architecture. This specification is based on the PCI Express Base Specification Revision 0.7, October 2009 and is subject to change pending the final release version of the specification.

Typical Phase Noise at 156.25MHz

Applications Information

Overdriving the XTAL Interface

The OSCI input can be overdriven by an LVCMOS driver or by one side of a differential driver through an AC coupling capacitor. The OSCO pin can be left floating. The amplitude of the input signal should be between 500mV and 1.8V and the slew rate should not be less than 0.2V/ns. For 3.3V LVCMOS inputs, the amplitude must be reduced from full swing to at least half the swing in order to prevent signal interference with the power rail and to reduce internal noise. [Figure 5A](#) shows an example of the interface diagram for a high speed 3.3V LVCMOS driver. This configuration requires that the sum of the output impedance of the driver (R_o) and the series resistance (R_s) equals the transmission line impedance. In addition, matched termination at the crystal input will attenuate the signal in half. This can be done in one of two ways. First, R1 and R2 in parallel should

equal the transmission line impedance. For most 50Ω applications, R1 and R2 can be 100Ω. This can also be accomplished by removing R1 and changing R2 to 50Ω. The values of the resistors can be increased to reduce the loading for a slower and weaker LVCMOS driver. [Figure 5B](#) shows an example of the interface diagram for an LVPECL driver. This is a standard LVPECL termination with one side of the driver feeding the OSCI input. It is recommended that all components in the schematics be placed in the layout. Though some components might not be used, they can be utilized for debugging purposes. Input signal duty cycle worse than 50% will result in phase noise degradation. The datasheet specifications are characterized and guaranteed by using a quartz crystal as the input.

Figure 5A. General Diagram for LVCMOS Driver to XTAL Input Interface

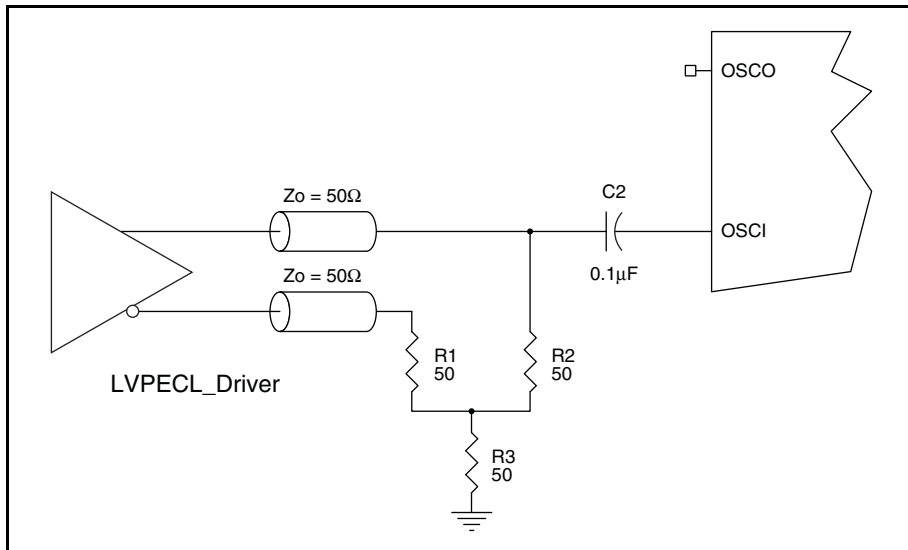

Figure 5B. General Diagram for LVPECL Driver to XTAL Input Interface

Wiring the Differential Input to Accept Single-Ended Levels

Figure 6 shows how a differential input can be wired to accept single ended levels. The reference voltage $V_{REF} = V_{CC}/2$ is generated by the bias resistors R1 and R2. The bypass capacitor (C1) is used to help filter noise on the DC bias. This bias circuit should be located as close to the input pin as possible. The ratio of R1 and R2 might need to be adjusted to position the V_{REF} in the center of the input voltage swing. For example, if the input clock swing is 2.5V and $V_{CC} = 3.3V$, R1 and R2 value should be adjusted to set V_{REF} at 1.25V. The values below are for when both the single ended swing and V_{CC} are at the same voltage. This configuration requires that the sum of the output impedance of the driver (R_o) and the series resistance (R_s) equals the transmission line impedance. In addition, matched termination at the input will attenuate the signal in half. This can be done in one of two ways. First, R3 and R4 in parallel should equal the transmission line impedance. For most 50Ω applications, R3 and R4 can be 100Ω.

The values of the resistors can be increased to reduce the loading for slower and weaker LVCMOS driver. When using single-ended signaling, the noise rejection benefits of differential signaling are reduced. Even though the differential input can handle full rail LVCMOS signaling, it is recommended that the amplitude be reduced while maintaining an edge rate faster than 1V/ns. The datasheet specifies a lower differential amplitude, however this only applies to differential signals. For single-ended applications, the swing can be larger, however V_{IL} cannot be less than -0.3V and V_{IH} cannot be more than $V_{CC} + 0.3V$. Though some of the recommended components might not be used, the pads should be placed in the layout. They can be utilized for debugging purposes. The datasheet specifications are characterized and guaranteed by using a differential signal.

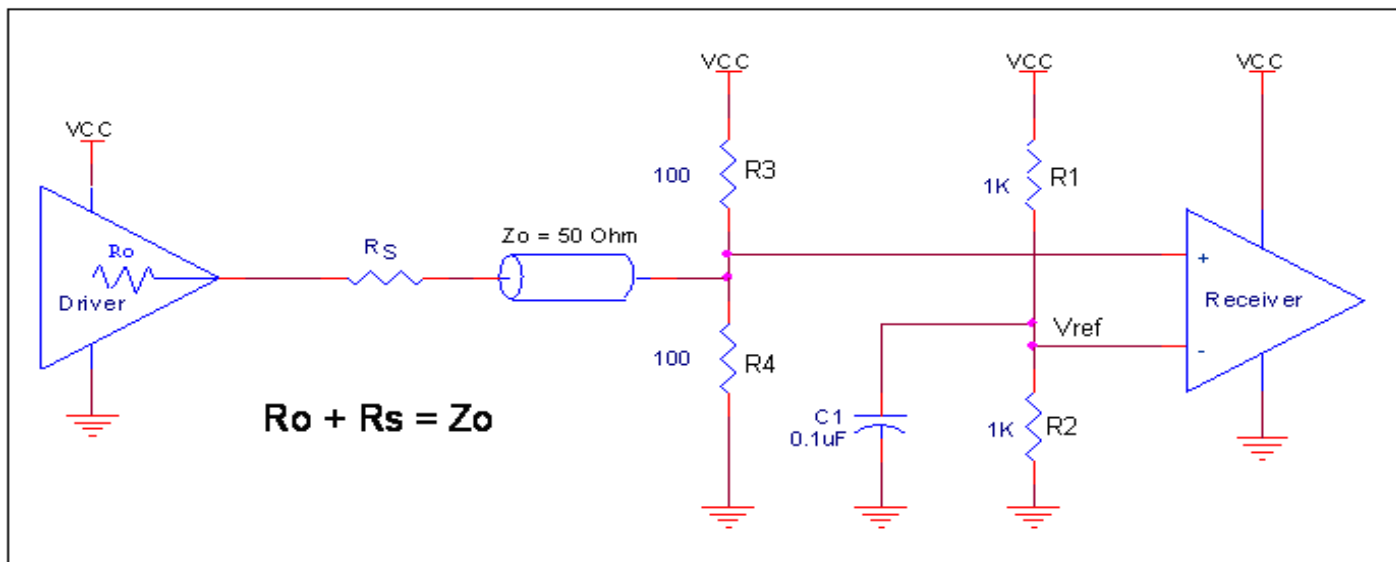

Figure 6. Recommended Schematic for Wiring a Differential Input to Accept Single-ended Levels

3.3V Differential Clock Input Interface

CLKx/nCLKx accepts LVDS, LVHSTL, LVPECL, HCSL and other differential signals. Both V_{SWING} and V_{OH} must meet the V_{PP} and V_{CMR} input requirements. [Figure 7A](#) to [Figure 7E](#) show interface examples for the CLKx/nCLKx input driven by the most common driver types. The input interfaces suggested here are examples only.

Please consult with the vendor of the driver component to confirm the driver termination requirements. For example, in [Figure 7A](#), the input termination applies for IDT open emitter LVHSTL drivers. If you are using an LVHSTL driver from another vendor, use their termination recommendation.

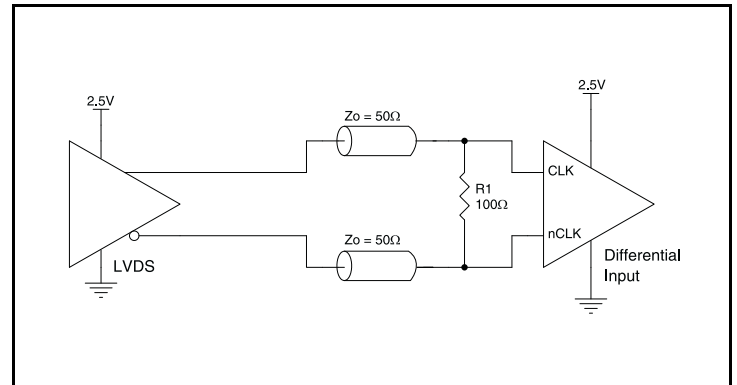

Figure 8D. CLKx/nCLKx Input Driven by a 2.5V LVDS Driver

Recommendations for Unused Input and Output Pins

Inputs:

CLKx/nCLKx Input

For applications not requiring the use one or more reference clock inputs, both CLKx and nCLKx can be left floating. Though not required, but for additional protection, a 1k Ω resistor can be tied from CLKx to ground. It is recommended that CLKx, nCLKx not be driven with active signals when not enabled for use.

LVC MOS Control Pins

All control pins have internal pullups or pulldowns; additional resistance is not required but can be added for additional protection. A 1k Ω resistor can be used.

Outputs:

LVPECL Outputs

Any unused LVPECL output pairs can be left floating. We recommend that there is no trace attached. Both sides of the differential output pair should either be left floating or terminated.

LVDS Outputs

Any unused LVDS output pairs can be either left floating or terminated with 100 Ω across. If they are left floating there should be no trace attached.

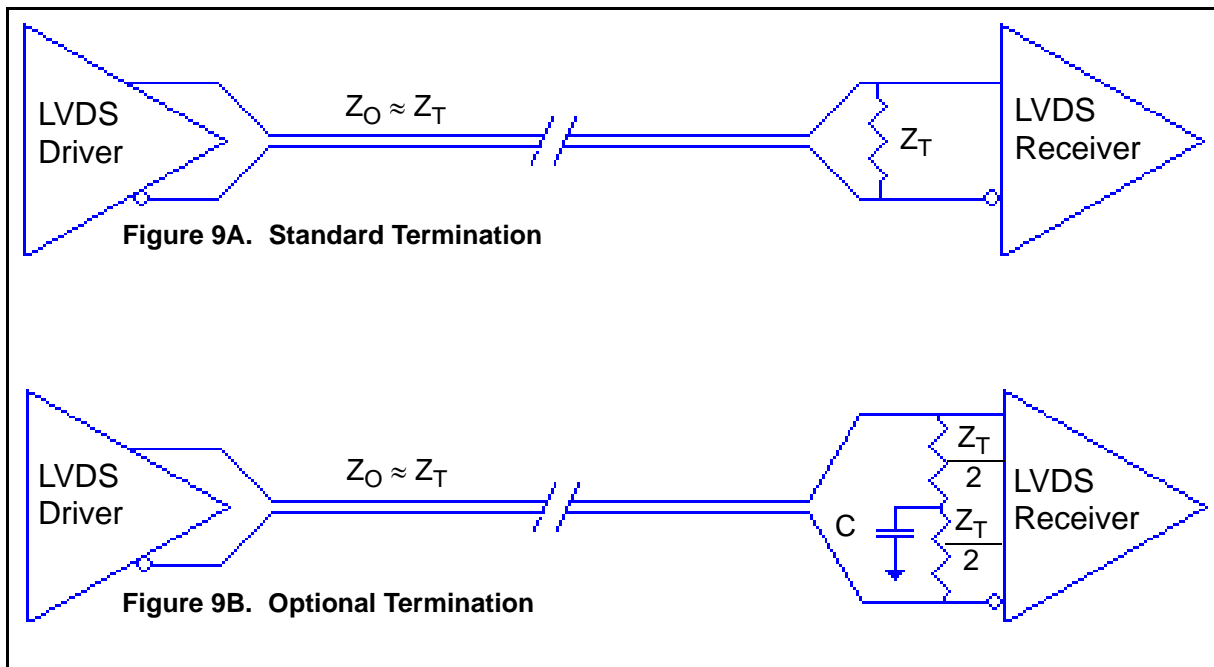

LVC MOS Outputs

Any LVC MOS output can be left floating if unused. There should be no trace attached.

LVDS Driver Termination

For a general LVDS interface, the recommended value for the termination impedance (Z_T) is between 90 Ω and 132 Ω . The actual value should be selected to match the differential impedance (Z_0) of your transmission line. A typical point-to-point LVDS design uses a 100 Ω parallel resistor at the receiver and a 100 Ω differential transmission-line environment. In order to avoid any transmission-line reflection issues, the components should be surface mounted and must be placed as close to the receiver as possible. IDT offers a full line of LVDS compliant devices with two types of output structures: current source and voltage source. The

standard termination schematic as shown in [Figure 9A](#) can be used with either type of output structure. [Figure 9B](#), which can also be used with both output types, is an optional termination with center tap capacitance to help filter common mode noise. The capacitor value should be approximately 50pF. If using a non-standard termination, it is recommended to contact IDT and confirm if the output structure is current source or voltage source type. In addition, since these outputs are LVDS compatible, the input receiver's amplitude and common-mode input range should be verified for compatibility with the output.

Termination for 3.3V LVPECL Outputs

The clock layout topology shown below is a typical termination for LVPECL outputs. The two different layouts mentioned are recommended only as guidelines.

The differential outputs generate ECL/LVPECL compatible outputs. Therefore, terminating resistors (DC current path to ground) or current sources must be used for functionality. These outputs are

designed to drive 50Ω transmission lines. Matched impedance techniques should be used to maximize operating frequency and minimize signal distortion. [Figure 10A](#) and [Figure 10B](#) show two different layouts which are recommended only as guidelines. Other suitable clock layouts may exist and it would be recommended that the board designers simulate to guarantee compatibility across all printed circuit and clock component process variations.

Figure 10A. 3.3V LVPECL Output Termination

Figure 10B. 3.3V LVPECL Output Termination

Termination for 2.5V LVPECL Outputs

Figure 11A and Figure 11B show examples of termination for 2.5V LVPECL driver. These terminations are equivalent to terminating 50Ω to $V_{CCO} - 2V$. For $V_{CCO} = 2.5V$, the $V_{CCO} - 2V$ is very close to ground

level. The R3 in Figure 11B can be eliminated and the termination is shown in Figure 11C.

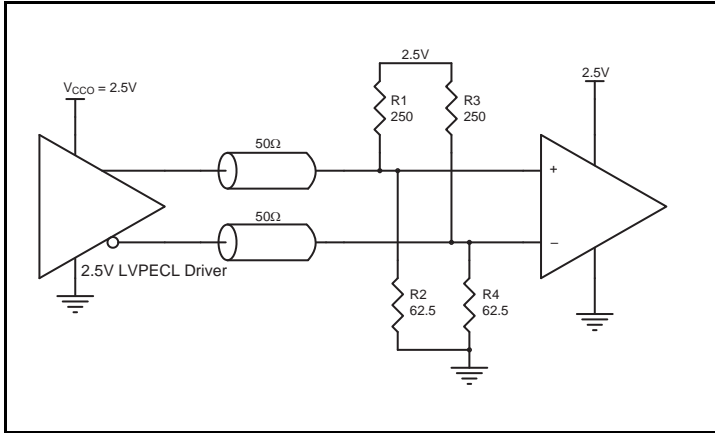

Figure 11A. 2.5V LVPECL Driver Termination Example

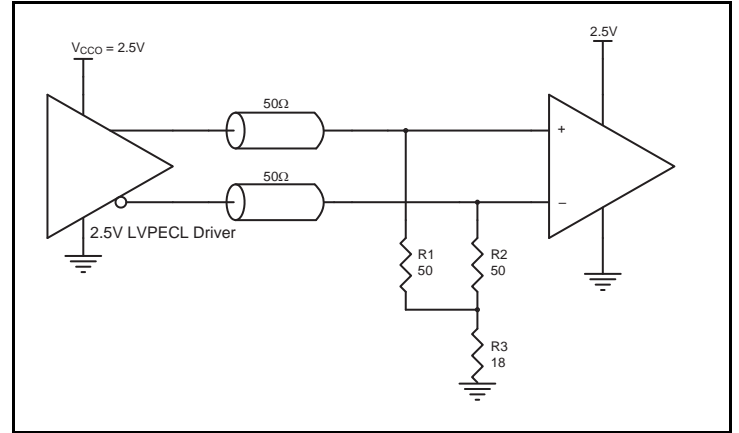

Figure 11C. 2.5V LVPECL Driver Termination Example

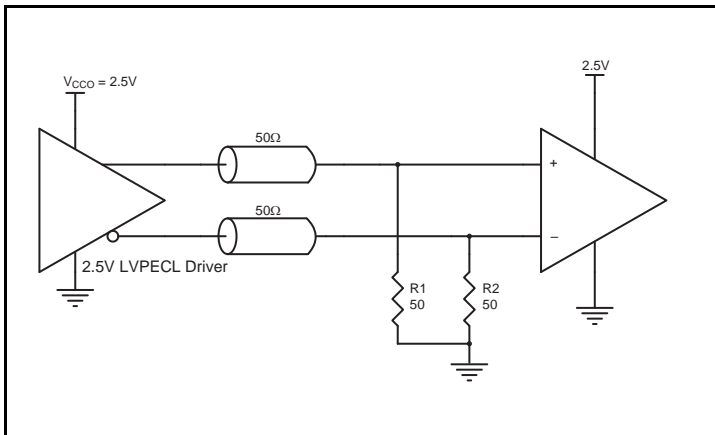

Figure 11B. 2.5V LVPECL Driver Termination Example

2.5V and 3.3V HCSL Output Termination

Figure 12A is the recommended source termination for applications where the driver and receiver will be on a separate PCBs. This termination is the standard for PCI Express™ and HCSL output

types. All traces should be 50Ω impedance single-ended or 100Ω differential.

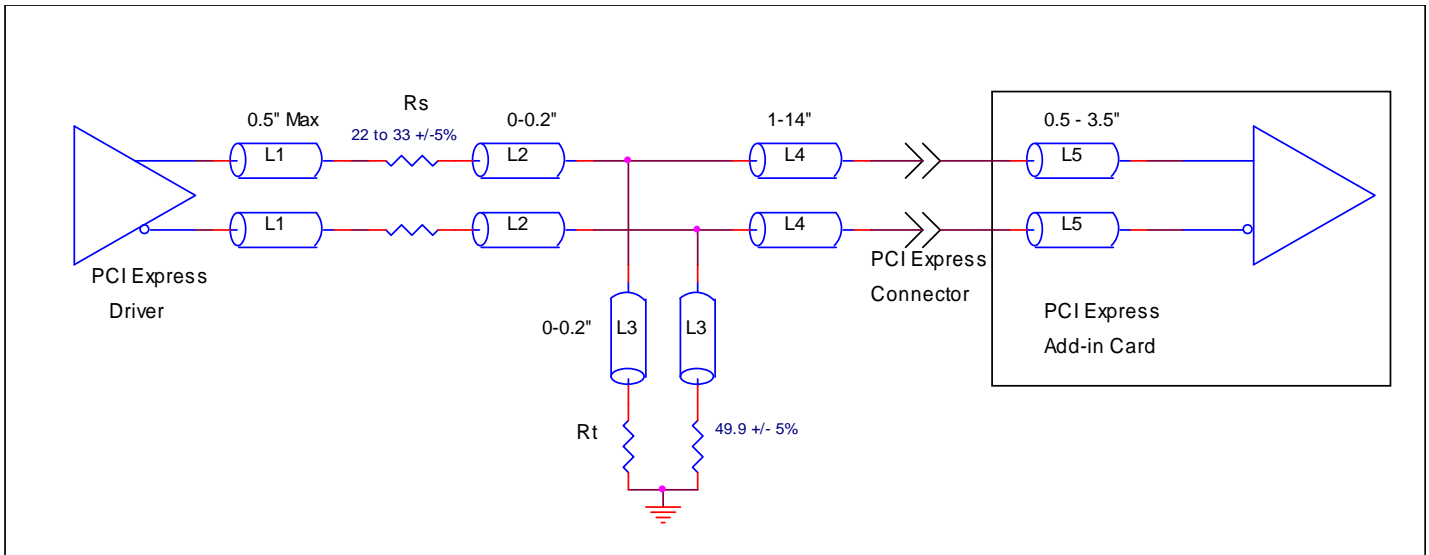

Figure 12A. Recommended Source Termination (where the driver and receiver will be on separate PCBs)

Figure 12B is the recommended termination for applications where a point-to-point connection can be used. A point-to-point connection contains both the driver and the receiver on the same PCB. With a matched termination at the receiver, transmission-line reflections will

be minimized. In addition, a series resistor (Rs) at the driver offers flexibility and can help dampen unwanted reflections. The optional resistor can range from 0Ω to 33Ω. All traces should be 50Ω impedance single-ended or 100Ω differential.

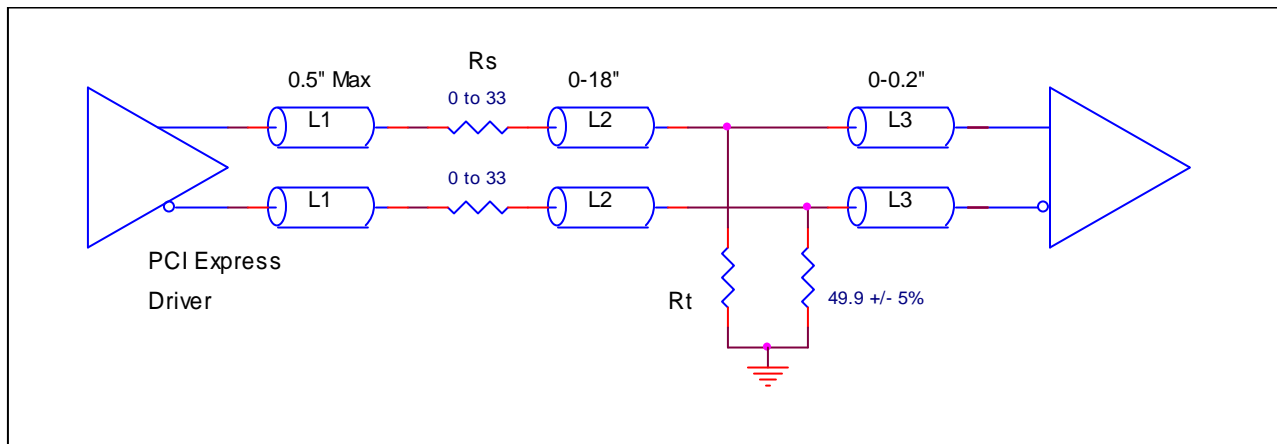

Figure 12B. Recommended Termination (where a point-to-point connection can be used)

VFQFN EPAD Thermal Release Path

In order to maximize both the removal of heat from the package and the electrical performance, a land pattern must be incorporated on the Printed Circuit Board (PCB) within the footprint of the package corresponding to the exposed metal pad or exposed heat slug on the package, as shown in [Figure 13](#). The solderable area on the PCB, as defined by the solder mask, should be at least the same size/shape as the exposed pad/slug area on the package to maximize the thermal/electrical performance. Sufficient clearance should be designed on the PCB between the outer edges of the land pattern and the inner edges of pad pattern for the leads to avoid any shorts.

While the land pattern on the PCB provides a means of heat transfer and electrical grounding from the package to the board through a solder joint, thermal vias are necessary to effectively conduct from the surface of the PCB to the ground plane(s). The land pattern must be connected to ground through these vias. The vias act as “heat pipes”. The number of vias (i.e. “heat pipes”) are application specific

and dependent upon the package power dissipation as well as electrical conductivity requirements. Thus, thermal and electrical analysis and/or testing are recommended to determine the minimum number needed. Maximum thermal and electrical performance is achieved when an array of vias is incorporated in the land pattern. It is recommended to use as many vias connected to ground as possible. It is also recommended that the via diameter should be 12 to 13mils (0.30 to 0.33mm) with 1oz copper via barrel plating. This is desirable to avoid any solder wicking inside the via during the soldering process which may result in voids in solder between the exposed pad/slug and the thermal land. Precautions should be taken to eliminate any solder voids between the exposed heat slug and the land pattern. Note: These recommendations are to be used as a guideline only. For further information, please refer to the Application Note on the Surface Mount Assembly of Amkor's Thermally/Electrically Enhance Lead frame Base Package, Amkor Technology.

Figure 13. P.C. Assembly for Exposed Pad Thermal Release Path – Side View (drawing not to scale)

Schematic and Layout Information

Schematics for 8T49N285 can be found on IDT.com. Please search for the 8T49N285 device and click on the link for evaluation board schematics.

Crystal Recommendation

This device was validated using FOX 277LF series through-hole crystals including part #277LF-40-18 (40MHz) and 277LF-38.88-2 (38.88MHz). If a surface mount crystal is desired, we recommend FOX Part #603-40-48 (40MHz) or 603-38.88-7 (38.88MHz).

I²C Serial EEPROM Recommendation

The 8T49N285 was designed to operate with most standard I²C serial EEPROMs of 256 bytes or larger. Atmel AT24C04C was used during device characterization and is recommended for use. Please contact IDT for review of any other I²C EEPROM's compatibility with the 8T49N285.

PCI Express Application Note

PCI Express jitter analysis methodology models the system response to reference clock jitter. The block diagram below shows the most frequently used *Common Clock Architecture* in which a copy of the reference clock is provided to both ends of the PCI Express Link.

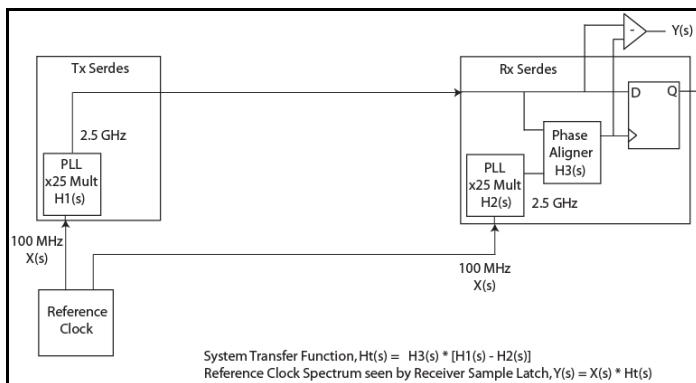

In the jitter analysis, the transmit (Tx) and receive (Rx) serdes PLLs are modeled as well as the phase interpolator in the receiver. These transfer functions are called H1, H2, and H3 respectively. The overall system transfer function at the receiver is:

$$H_t(s) = H_3(s) \times [H_1(s) - H_2(s)]$$

The jitter spectrum seen by the receiver is the result of applying this system transfer function to the clock spectrum X(s) and is:

$$Y(s) = X(s) \times H_3(s) \times [H_1(s) - H_2(s)]$$

In order to generate time domain jitter numbers, an inverse Fourier Transform is performed on $X(s) \times H_3(s) \times [H_1(s) - H_2(s)]$.

PCI Express Common Clock Architecture

For **PCI Express Gen 1**, one transfer function is defined and the evaluation is performed over the entire spectrum: DC to Nyquist (e.g. for a 100MHz reference clock: 0Hz – 50MHz) and the jitter result is reported in peak-peak.

PCI Express Gen 1 Magnitude of Transfer Function

For **PCI Express Gen 2**, two transfer functions are defined with 2 evaluation ranges and the final jitter number is reported in rms. The two evaluation ranges for PCI Express Gen 2 are 10kHz – 1.5MHz (Low Band) and 1.5MHz – Nyquist (High Band). The plots show the individual transfer functions as well as the overall transfer function Ht.

PCIe Gen 2A Magnitude of Transfer Function

PCIe Gen 2B Magnitude of Transfer Function

For **PCI Express Gen 3**, one transfer function is defined and the evaluation is performed over the entire spectrum. The transfer function parameters are different from Gen 1 and the jitter result is reported in RMS.

PCIe Gen 3 Magnitude of Transfer Function

For a more thorough overview of PCI Express jitter analysis methodology, please refer to IDT Application Note *PCI Express Reference Clock Requirements*.

Power Dissipation and Thermal Considerations

The 8T49N285 is a multi-functional, high speed device that targets a wide variety of clock frequencies and applications. Since this device is highly programmable with a broad range of features and functionality, the power consumption will vary as each of these features and functions is enabled.

The 8T49N285 device was designed and characterized to operate within the ambient industrial temperature range of -40°C to +85°C. The ambient temperature represents the temperature around the device, not the junction temperature. When using the device in extreme cases, such as maximum operating frequency and high ambient temperature, external air flow may be required in order to ensure a safe and reliable junction temperature. Extreme care must be taken to avoid exceeding 125°C junction temperature.

The power calculation examples below were generated using a maximum ambient temperature and supply voltage. For many applications, the power consumption will be much lower. Please contact IDT technical support for any concerns on calculating the power dissipation for your own specific configuration.

Power Domains

The 8T49N285 device has a number of separate power domains that can be independently enabled and disabled via register accesses (all power supply pins must still be connected to a valid supply voltage). [Figure 14](#) below indicates the individual domains and the associated power pins.

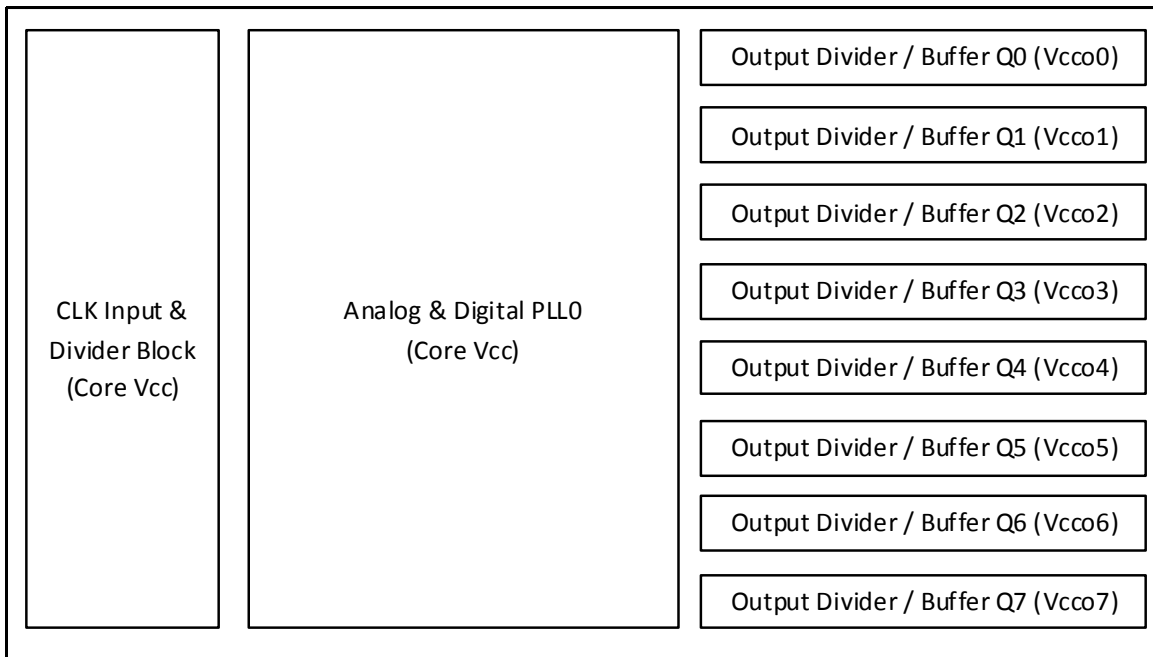

Figure 14. 8T49N285 Power Domains

For the output paths shown above, there are three different structures that are used. Q0 and Q1 use one output path structure, Q2 and Q3 use a second structure and Q[4:7] use a 3rd structure. Power consumption data will vary slightly depending on the structure used as shown in the appropriate tables below.

Power Consumption Calculation

Determining total power consumption involves several steps:

1. Determine the power consumption using maximum current values for core and analog voltage supplies from [Table 7A](#) and [Table 7B](#).
2. Determine the nominal power consumption of each enabled output path.
 - a. This consists of a base amount of power that is independent of operating frequency, as shown in [Table 15A](#) through [Table 15I](#) (depending on the chosen output protocol).
 - b. Then there is a variable amount of power that is related to the output frequency. This can be determined by multiplying the output frequency by the FQ_Factor shown in [Table 15A](#) through [Table 15I](#).
3. All of the above totals are then summed.

Thermal Considerations

Once the total power consumption has been determined, it is necessary to calculate the maximum operating junction temperature for the device under the environmental conditions it will operate in. Thermal conduction paths, air flow rate and ambient air temperature are factors that can affect this. The thermal conduction path refers to whether heat is to be conducted away via a heatsink, via airflow or via conduction into the PCB through the device pads (including the ePAD). Thermal conduction data is provided for typical scenarios in [Table 14](#) below. Please contact IDT for assistance in calculating results under other scenarios.

Applying the values to the following equation will yield output current by frequency:

$$Qx \text{ Current (mA)} = FQ_Factor * \text{Frequency (MHz)} + \text{Base_Current}$$

where:

Qx Current is the specific output current according to output type and frequency

FQ_Factor is used for calculating current increase due to output frequency

Base_Current is the base current for each output path independent of output frequency

The second step is to multiply the power dissipated by the thermal impedance to determine the maximum power gradient, using the following equation:

$$T_J = T_A + (\theta_{JA} * Pd_{total})$$

where:

T_J is the junction temperature (°C)

T_A is the ambient temperature (°C)

θ_{JA} is the thermal resistance value from [Table 14](#), dependent on ambient airflow (°C/W)

Pd_{total} is the total power dissipation of the 8T49N285 under usage conditions, including power dissipated due to loading (W)

Note that the power dissipation per output pair due to loading is assumed to be 27.95mW for LVPECL outputs and 44.5mW for HCSL outputs. When selecting LVCMOS outputs, power dissipation through the load will vary based on a variety of factors including termination type and trace length. For these examples, power dissipation through loading will be calculated using C_{PD} (found in [Table 2](#)) and output frequency:

$$Pd_{OUT} = C_{PD} * F_{OUT} * V_{CCO}^2$$

where:

Pd_{OUT} is the power dissipation of the output (W)

C_{PD} is the power dissipation capacitance (pF)

F_{OUT} is the output frequency of the selected output (MHz)

V_{CCO} is the voltage supplied to the appropriate output (V)

Example Calculations

Example 1. Common Customer Configuration (3.3V Core Voltage)

Output	Output Type	Frequency (MHz)	V _{CCO}
Q0	LVPECL	625	3.3
Q1	LVPECL	625	3.3
Q2	HCSL	212.5	3.3
Q3	HCSL	212.5	3.3
Q4	LVDS	25	3.3
Q5	LVDS	25	3.3
Q6	LVC MOS	125	3.3
Q7	LVC MOS	125	3.3

- Core Supply Current, I_{CC} = **90mA (max)**
- Analog Supply Current, I_{CCA} = **187mA (max)**
 - Q0 Current = 0.00593x625 + 40.1 = 43.8mA
 - Q1 Current = 0.00593x625 + 40.1 = 43.8mA
 - Q2 Current = 0.01358x212.5 + 63.8 = 66.69mA
 - Q3 Current = 0.01358x212.5 + 63.8 = 66.69mA
 - Q4 Current = 0.00630x25 + 51.3 = 51.46mA
 - Q5 Current = 0.00630x25 + 51.3 = 51.46mA
 - Q6 Current = 40.6mA
 - Q7 Current = 40.6mA
- Total Output Current = **405.1mA (max)**
 - Total Device Current = 90mA + 187mA + 405.1mA = **682.1mA**
 - Total Device Power = 3.465V * 682.1mA = **2363.5mW**
- Power dissipated through output loading:
 - LVPECL = 27.95mW * 2 = **55.9mW**
 - HCSL = 44.5mW * 2 = **89mW**
 - LVDS = already accounted for in device power
 - LVC MOS = 14.5pF * 125MHz * 3.465V² * 2 output pairs = **43.5mW**
- Total Power = 2363.5mW + 55.9mW + 89mW + 43.5mW = **2551.9mW or 2.55W**

With an ambient temperature of 85°C and no airflow, the junction temperature is:

$$T_J = 85^{\circ}\text{C} + 16.0^{\circ}\text{C/W} * 2.55\text{W} = \mathbf{125.8^{\circ}\text{C}}$$

This junction temperature is above the maximum allowable. In instances where maximum junction temperature is exceeded adjustments need to be made to either airflow or ambient temperature. In this case, adjusting airflow to 1m/s ($\theta_{JA} = 12.14^{\circ}\text{C/W}$) will reduce junction temperature to 116°C. If no airflow adjustments can be made, the maximum ambient operating temperature must be reduced by a minimum of 0.8°C.

Example 2. High-Frequency Customer Configuration (3.3V Core Voltage)

Output	Output Type	Frequency (MHz)	V _{CCO}
Q0	LVDS	156.25	2.5
Q1	LVDS	156.25	2.5
Q2	LVDS	161.133	2.5
Q3	LVC MOS	33.333	1.8
Q4	LVC MOS	25	1.8
Q5	LVC MOS	25	1.8
Q6	LVC MOS	25	1.8
Q7	LVDS	156.25	2.5

- Core Supply Current, I_{CC} = **85mA (max)**
- Analog Supply Current, I_{CCA} = **182mA (max)**
 - Q0 Current = 0.00366x156.25 + 40.8 = 41.37mA
 - Q1 Current = 0.00366x156.25 + 40.8 = 41.37mA
 - Q2 Current = 0.01148x161.133 + 64.5 = 66.35mA
 - Q3 Current = 51.4mA
 - Q4 Current = 30.3mA
 - Q5 Current = 30.3mA
 - Q6 Current = 30.3mA
 - Q7 Current = 0.00367x156.25 + 43.7 = 44.27mA
- Total Output Current = **193.36mA** (V_{CCO} = 2.5V), **142.3mA** (V_{CCO} = 1.8V)
 - Total Device Power = 2.625V *(85mA + 182mA + 193.36mA) + 1.89V * 142.3mA = **1477.4mW**
- Power dissipated through output loading:
 - LVPECL = n/a
 - LVDS = already accounted for in device power
 - LVC MOS_33.3MHz = 17pF * 33.3MHz * 1.89V² * 1 output pair = **2.02mW**
 - LVC MOS_25MHz = 12.5pF * 25MHz * 1.89V² * 3 output pairs = **3.35mW**
 - Total Power = 1477.4mW + 2.02mW + 3.35mW = **1482.77mW or 1.48W**

With an ambient temperature of 85°C, the junction temperature is:

$$T_J = 85^{\circ}\text{C} + 16.0^{\circ}\text{C/W} * 1.48\text{W} = \mathbf{108.7^{\circ}\text{C}}$$

This junction temperature is below the maximum allowable.

Reliability Information

Table 16. θ_{JA} vs. Air Flow Table for a 56-Lead VFQFN

θ_{JA} vs. Air Flow			
Meters per Second	0	1	2
Multi-Layer PCB, JEDEC Standard Test Boards	16.0°C/W	12.14°C/W	11.02°C/W

NOTE: Theta JA (θ_{JA}) values calculated using a 4-layer JEDEC PCB (114.3mm x 101.6mm), with 2oz. (70 μ m) copper plating on all 4 layers.

Transistor Count

The transistor count for 8T49N285 is: 998,958

56-Lead VFQFN NL Package Outline

Ordering Information

Table 17. Ordering Information

Part/Order Number	Marking	Package	Shipping Packaging	Temperature
8T49N285A-dddNLGI	IDT8T49N285A-dddNLGI	56-Lead VFQFN, Lead-Free	Tray	-40°C to +85°C
8T49N285A-dddNLGI8	IDT8T49N285A-dddNLGI	56-Lead VFQFN, Lead-Free	Tape & Reel, Pin 1 Orientation: EIA-481-C	-40°C to +85°C
8T49N285A-dddNLGI#	IDT8T49N285A-dddNLGI	56-Lead VFQFN, Lead-Free	Tape & Reel, Pin 1 Orientation: EIA-481-D	-40°C to +85°C

NOTE: For the specific, publicly available -ddd order codes, refer to *FemtoClock NG Universal Frequency Translator Ordering Product Information* document. For custom -ddd order codes, please contact IDT for more information.

Table 18. Pin 1 Orientation in Tape and Reel Packaging

Part Number Suffix	Pin 1 Orientation	Illustration
NLGI8	Quadrant 1 (EIA-481-C)	
NLGI#	Quadrant 2 (EIA-481-D)	

Revision History Sheet

Rev	Table	Page	Description of Change	Date
3	T11A	11 41 53 56	Device Start-up & Reset Behavior - added additional information (second paragraph). AC Characteristics Table - added missing minimum Output Frequency spec for Q2, Q3 (LVPECL, LVDS) and LVCMOS. "Termination for 3.3V LVPECL Outputs" - updated Figure 10A . "Crystal Recommendation" - included additional crystal recommendation. Deleted IDT prefix/suffix throughout the datasheet.	6/29/15
4	T17	66	Per PCN# W1512-01, Effective Date 03/18/2016 - changed Part/Order Number from 8T49N285-dddNLGI to 8T49N285A-dddNLGI, and Marking from IDT8T49N285-dddNLGI to IDT8T49N285A-dddNLGI. Updated Datasheet header/footer.	1/29/16
5		56	Crystal Recommendation - deleted IDT crystal reference.	10/26/16
